REDUCTION OF COMPUTER USAGE COSTS IN PREDICTING UNSTEADY AERODYNAMIC LOADINGS CAUSED BY CONTROL SURFACE MOTIONS - COMPUTER PROGRAM DESCRIPTION

**J. R. Petrarca, B. A. Harrison, M. C. Redman,
and W. S. Rowe**

SUMMARY

Based on the analyses in NASA CR 2543 and CR 3009, a digital computer program has been developed to calculate unsteady loadings caused by motions of lifting surfaces with leading edge and trailing edge controls based on the subsonic kernel function approach.

The pressure singularities at hinge line and side edges have been extracted analytically as a preliminary step to solving the integral equation by collocation.

The program calculates generalized aerodynamic forces for user supplied deflection modes. Optional intermediate output includes pressure at an array of points, and sectional generalized forces. From one to six controls on the half span can be accommodated.

A new network of chordwise and spanwise grids has been added to the numerical integration scheme, resulting in lower computing costs.

1.0 INTRODUCTION

This document describes in detail the design and usage of the FORTRAN IV digital computer program, RHOIV. The RHOIV program was written as an engineering tool to be used in calculation of unsteady aerodynamic loadings on lifting surfaces with leading edge and trailing edge control surfaces in compressible subsonic flow per the analysis techniques presented in references 1 and 2.

Features of this program include:

- Modal input in the form of surface deflections at arbitrary points — Input from disk file, tape, or cards
- Calculation of unsteady pressures at arbitrary points on the lifting surface planform
- Calculation of sectional generalized forces at arbitrary spanwise locations on the lifting surface planform
- Calculation of generalized forces
- Optional saving of unsteady pressures, sectional or total generalized forces for subsequent analysis

- Optimization of computer time through the capability to save and later re-use pressure/ kernel influence coefficient matrices (C-matrices)
- Capability to provide for airfoil thickness corrections using velocity profile modifications supplied by the user
- Capability to analyze up to six separate closed gap control surfaces
- Capability to analyze coupled main surface and control surface modes

Included in this document are:

- Description of equations used in the program
- Description of variable length storage requirements
- Description of user I/O and scratch file formats
- List of program limitations
- Description of computer program usage
- Data stacking procedures
- Description of program output - normal and diagnostic
- Sample problem input/output
- Description of program structure and routines used

2.0 DISCUSSION

2.1 GENERAL REMARKS

This section will present a description of the nomenclature and analysis as it appears in the RHOIV program. Although some information is given with each section, no attempt is made to develop or reference the sources of development of the theory involved. A full discussion of the latter is given in reference 1 of this document.

As described in reference 1, the problem of identifying the unsteady aerodynamic loading on a lifting surface without downwash discontinuities may be written as a boundary value problem.

$$W(x,y) = \frac{1}{4\pi\rho V^2} \iint \Delta P_r(\xi, \eta) \cdot K(x - \xi, y - \eta, k, M) d\xi d\eta \quad (1)$$

In equation (1), the left hand side, $W(x,y)$, is the Kinematic Downwash, or effective angle of attack of the surface, due to the structural vibration mode. The right hand side of the equation is the mathematical downwash which is derived from the surface integration of unsteady pressure times an aerodynamic influence function. The latter, called the Kernel Function, is dependent upon geometry, reduced frequency, and Mach number. The unsteady pressure is unknown; however, knowing the physical characteristics of loading, the unsteady pressure may be approximated by a linear combination of Assumed Pressure Terms which will satisfy loading characteristics.

$$\Delta P_r(\xi, \eta) = 4\rho V^2 \sqrt{S^2 - \eta^2} \sum a_j \Delta p_j(\xi, \eta), \quad j = 1, m$$

If the downwash integral equation, (1), is written for a number of discrete points on the surface, (downwash points, or collocation points, or control points), the resulting complex linear system of equations may be expressed in matrix form as,

$$\left\{ W(x,y) \right\} = [C] \left\{ a \right\} \quad (2)$$

where the elements of the C-matrix are

$$C_{ij} = \frac{1}{\pi} \iint \Delta p_j(\xi, \eta) \cdot K(x_i - \xi, y_i - \eta, k, M) d\xi d\eta$$

(Note that the C-matrix terms are independent of structural mode.) For a simple lifting surface problem, solution of equation (2) for the unknown coefficients of the assumed pressure terms, $\{a_j\}$, allows one to calculate the unsteady pressure at any point on the surface or integrate the unsteady pressure times modal displacements to give generalized force.

With the introduction of control surface motion relative to the remainder of the lifting surface (main surface) the problem becomes somewhat more difficult. In particular, the kinematic downwash distribution or sheet will contain a step discontinuity at the control surface with respect to the main surface. The use of additional assumed pressure terms with unknown

coefficients to match the discontinuous boundary condition is prone to numeric difficulties. However, a pressure term associated with control surface rotation may be written which will give the required jump at the hinge and control surface side edge and which has a known coefficient. Thus,

$$W^* (x,y) = \frac{1}{4\pi\rho V^2} \iint \Delta P_s (\xi, \eta) \cdot K (x - \xi, y - \eta, k, M) d\xi d\eta \quad (3)$$

where $W^* (x,y)$ will have the same jump discontinuity at the hinge and side edge as $W (x,y)$ and will be relatively smooth away from the hinge. The control surface unsteady pressure term in equation (3) is a function of the control surface rotation at η , $\theta(\eta)$, i.e., is dependent upon the structural mode. The control surface rotation is approximated by a cubic equation.

$$\theta (\eta) = A_0 + A_1 \eta_{cs} + A_2 \eta_{cs}^2 + A_3 \eta_{cs}^3 \quad (4)$$

where

$$\eta_{cs} = \frac{\eta - y_i}{y_o - y_i}$$

y_i = Inboard side edge of control surface

y_o = Outboard side edge of control surface

This representation of control surface rotation should suffice for a broad range of control surface twist. The expression for the assumed control surface pressure term is then

$$\Delta P_s (\xi, \eta) = 4\rho V^2 \sqrt{S^2 - \eta^2} \sum_{j=1}^4 A_j \Delta \bar{p}_j (\xi, \eta)$$

If equation (3) is written for the downwash points and expressed in matrix form,

$$\{W^* (x,y)\} = [C^*] \{A\}$$

where the elements of the control surface C-matrix are

$$C^*_{ij} = \frac{1}{\pi} \iint \Delta \bar{p}_j (\xi, \eta) \cdot K (x_i - \xi, y_i - \eta, k, M) d\xi d\eta$$

and significantly, because of the polynomial representation of control surface rotation, are not dependent upon structural mode. If the kinematic downwash is modified by removing any discontinuity due to control surface rotation,

$$\bar{W} (x,y) = W (x,y) - W^* (x,y)$$

the resulting residual downwash sheet, $\bar{W} (x,y)$, which is smooth, may be used to solve for the unknown coefficients of the assumed main surface pressure terms $\{a_j\}$. The total unsteady

pressure is then a combination of main surface pressure and control surface pressure.

$$\Delta P (\xi, \eta) = \Delta P_T (\xi, \eta) + \Delta P_S (\xi, \eta)$$

Thus unsteady pressure may be calculated at any point on the surface or integrated to produce generalized forces as in the simple lifting surface problem.

2.2 NOMENCLATURE

The RHOIV program works with dimensional coordinates (ξ, η) and non-dimensional coordinates $(\underline{\xi}, \underline{\eta})$. The b_0 reference length used in reference 1 for k value and non-dimensionalizing of all coordinates is used in RHOIV only to arrive at $k = \omega/V$ from the user input $k = b_0\omega/V$. Note that differences in nomenclature between reference 1 and this section are noted parenthetically with the symbols.

Symbols	Description
$A (n;m,j)$	Cubic coefficients ($m = 1, \dots, 4$) in $\underline{\eta}_{CS}$ for mode j , for control surface n .
$a (m, j)$	Undetermined coefficients of assumed main surface pressure terms for mode j . ($m = 1, \dots$, no. of downwash points)
b_0	Reduced frequency reference length.
$b (\eta)$	Local planform semi-chord. $b(\eta) = 0.5 [\xi_t (\eta) - \xi_l (\eta)]$
$C(x,y;m)$	C-matrix terms for downwash point (x, y) associated with assumed main surface pressure terms ($m = 1, \dots$, no. downwash points)
$C^*(x,y,n;m)$	C-matrix terms for downwash point (x,y) associated with control surface n pressure terms ($m = 1, \dots, 4$)
C	Chordwise integral of $g (\xi, \eta) K (x_0, y_0, k, M)$, Eqn. (6).
C_1, C_2	Coefficients associated with control pressure expressions, Eqns. (17, 18).
E_1, E_2, E_3	Chordwise modification functions associated with control pressure expressions, Eqns. (19, 20).
$f (\eta;i)$	"Spanwise" portions of a pressure term. ($i = 1, \dots$, no. of chords, main surface analysis) ($i = 1, \dots, 4$, control surface analysis)
$F (x,y,\eta)$	Portion of downwash integral expression, Eqn. (8).
$G (x,y,\eta)$	Portion of downwash integral expression, Eqn. (7).
$G_{IS}, G_{S1}, G_{S2}, G_{L1}, G_{L2}, G_{AT}$	Portions of pressure expression associated with full chord control

Symbol	Description
$g(\xi, \eta; j)$	“Chordwise” portion of pressure term, ($j = 1, \dots, \text{no. pts./chord, main surface}$) ($j = 1$, control surface analysis).
H	Spanwise modification function associated with control pressure expressions, Eqn. (17).
h	Integration limit in kernel function evaluation.
i	$\sqrt{-1}$, or i -th displacement mode, or i -th “spanwise” pressure term.
I_1	Modified Bessel function.
j	j -th displacement mode, or j -th “chordwise” pressure term.
$K(x_0, y_0, k, M)$	Full kernel expression.
$K_{ns}(x_0, y_0, k, M)$	Non-singular portion of K .
$K_s(x_0, y_0, k, M)$	Singular portion of K .
K_1	Modified Bessel function.
k	Reduced frequency, $k = \omega/V$.
$k_r [k]$	Reference reduced frequency, $k_r = b_0 \omega/V$.
L_1	Struve function.
L_1, L_2	Portions of pressure expression associated with full chord control.
M	Mach number.
$M(\xi - x_s, \eta - y_s)$	Portion of pressure expression associated with partial chord control.
m	A pressure term number.
$N(\xi - x_s, \eta - y_s)$	Portion of pressure expression associated with partial chord control.
n	A control surface number.
$\Delta P(\xi, \eta; j)$	Total change in pressure for mode j at point (ξ, η) . $P(\text{lower}) - P(\text{upper})$.
$\Delta P_r(\xi, \eta; j)$	That portion of ΔP associated with the regular (assumed main surface) pressure terms.
$\Delta P_s(\xi, \eta, n; j)$ $\Delta P_{ae}(\xi, \eta)$	That portion of ΔP associated with the pressure terms for control surface n .
$\Delta p(\xi, \eta; m)$	The m -th assumed main surface pressure term value at (ξ, η) .

$\overline{\Delta p}(\xi, \eta, n; m)$	The m-th pressure term associated with control surface n, value at (ξ, η) .
q	Dynamic pressure, $q = 0.5\rho V^2$.
Q_1	Portion of pressure expression associated with full chord control.
$Q(i, j)$	Generalized force (generalized unsteady aerodynamic coefficient) for displacement mode i, pressure mode j.
$Q_r(i, j)$	That portion of Q associated with the regular (assumed main surface) pressure terms.
$Q_s(n; i, j)$	That portion of Q associated with the pressure terms for control surface n.
$\overline{Q}_r(i, m)$	Surface integral of $Z(\xi, \eta; i) \Delta p(\xi, \eta; m)$.
$Q^s(\eta; i, j)$	Sectional generalized force (sectional generalized unsteady aerodynamic coefficient) for station η , displacement in mode i, pressure in mode j.
$Q_r^s(\eta; i, j)$	That portion of Q^s associated with the regular (assumed main surface) pressure term.
$Q_s^s(\eta, n; i, j)$	That portion of Q^s associated with the pressure terms for control surface n.
$\overline{Q}_r^s(\eta; i, m)$	Chordwise integral of $Z(\xi, \eta; i) \Delta p(\xi, \eta; m)$.
R	A modified distance between points in kernel and control pressure expressions.
S	Planform semispan.
t	Time.
$Tl(x, y, y)$	Logarithmic singularity subtraction term.
$u[V_1]$	Local streamwise velocity.
V	Remote freestream velocity.
$W(x, y; j)$	Kinematic downwash at (x, y) for mode j.
$W^*(x, y, n; j)$	Mathematical downwash at (x, y) for mode j due to control surface n pressure terms.
$W(x, y; j)$	Residual downwash at (x, y) in mode j; i.e., W with all control surface discontinuities removed.
w	Local normal (z) velocity.
$x[b_0x]$	Downwash point chordwise coordinate.

x_s, x_i, x_o	Control surface hinge corner (i = inboard), (o = outboard).
x_o	$x - \xi$.
y	Downwash point spanwise coordinate.
y_o	$y - \eta$.
y_s, y_i, y_o	Control surface side edge (i = inboard), (o = outboard).
$z(x, y, t) [Z]$	Time dependent modal displacement normal to surface.
$Z(x, y; i)$	Modal displacement normal to surface at (x, y) in mode i.
β	$\sqrt{1 - M^2}$
β_H	$\sqrt{\beta^2 + \tan^2 \Lambda_H}$
β_L	$\sqrt{\beta^2 + \tan^2 \Lambda_L}$
η	Dimensional spanwise coordinate.
$\underline{\eta}$	Non-dimensional spanwise coordinate, $\underline{\eta} = \eta/S$.
$\underline{\eta}_{cs}$	Non-dimensional spanwise coordinate referenced to control surface span, $\underline{\eta}_{cs} = (\eta - y_i) / (y_o - y_i)$.
θ	“Chordwise” non-dimensional pressure term coordinate, $\theta = \cos^{-1}(-\underline{\xi})$.
$\theta(\eta) [\theta_H]$	Control surface streamwise hinge rotation.
Λ_H	Control surface hinge sweep.
Λ_L	Control surface leading edge sweep.
ξ	Dimensional chordwise coordinate.
$\underline{\xi}(\eta)$	Non-dimensional chordwise coordinate, $\underline{\xi} = [\xi - \xi_m(\eta)] / b(\eta)$.
$\xi_c(\eta)$	Control surface hinge value.
$\xi_l(\eta)$	Planform leading edge value.
$\xi_m(\eta)$	Planform midchord value, $\xi_m = [\xi_t(\eta) + \xi_l(\eta)] / 2$.
$\xi_t(\eta)$	Planform trailing edge value.
ρ	Fluid mass density.
ϕ	“Spanwise” non-dimensional pressure term coordinate, $\phi = \cos^{-1}(\underline{\eta})$.
ω	Circular frequency of oscillation.

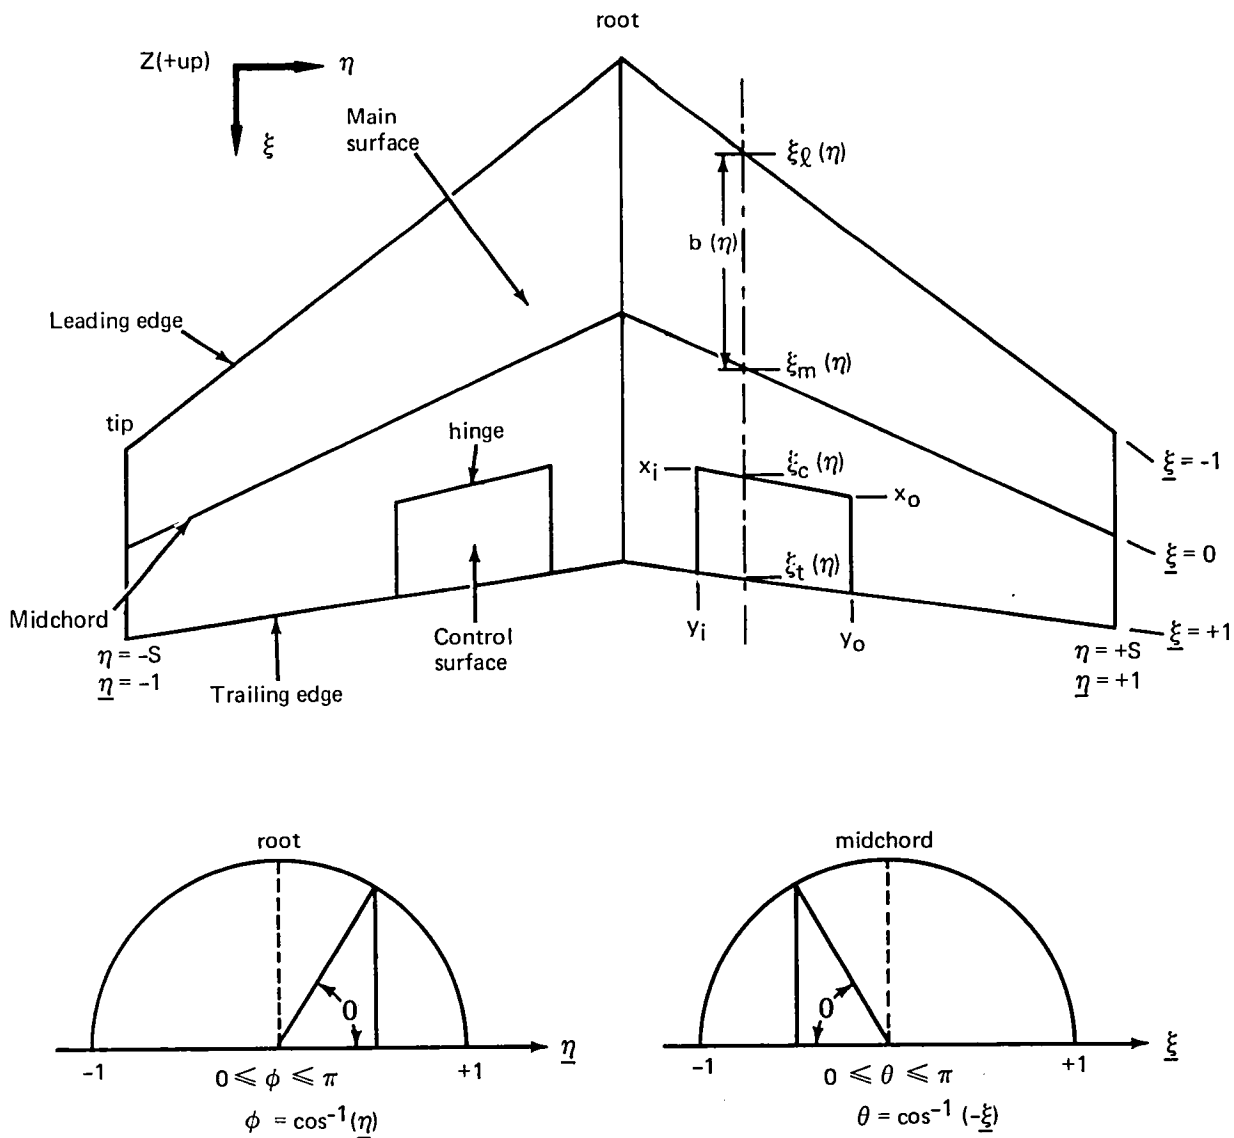

Figure 1.—Planview of Lifting Surface and Coordinate System

2.3 DOWNWASH INTEGRAL EQUATION

The downwash integral equation, which relates kinematic and mathematical downwash, is

$$W(x, y) = \frac{1}{\pi} \int_{-S}^S \sqrt{S^2 - \eta^2} \left[f(\eta) C + \frac{G(x, y, \eta)}{y_0^2} - \frac{G'(x, y, \eta)}{y_0} \right] d\eta + G(x, y, y) + yG'(x, y, y) \quad (5)$$

where C is the integral of the product of the chordwise pressure term and the kernel function.

$$C = \int_{\xi_\ell}^{\xi_t} g(\xi, \eta) K_{ns}(x_0, y_0, k, M) d\xi + \int_{\xi_\ell}^{\xi_t} g(\xi, \eta) K_s(x_0, y_0, k, M) d\xi \quad (6)$$

and $G(x, y, \eta)$ and $G'(x, y, \eta)$ are related to the evaluation of the dipole singularity; see reference 1.

$$G(x, y, \eta) = f(\eta) F(x, y, \eta) \quad (7)$$

$$G'(x, y, \eta) = \frac{\partial G(x, y, \eta)}{\partial \eta} = f'(\eta) F(x, y, \eta) + f(\eta) F'(x, y, \eta)$$

$$G(x, y, y) = \lim_{\eta \rightarrow y} G(x, y, \eta)$$

where $\Delta p(\xi, \eta) = f(\eta) g(\xi, \eta)$ is the loading function, and

$$F(x, y, \eta) = \int_{\xi_\ell}^{\xi_t} g(\xi, \eta) \left[1 + \frac{x_0}{\sqrt{x_0^2 + \beta^2 y_0^2}} \right] e^{ikx_0} d\xi \quad (8)$$

$$F(x, y, y) = 2 \cdot \int_{\xi_\ell}^x [g(\xi, y)] e^{ikx_0} d\xi$$

$$F'(x, y, \eta) = \frac{\partial F(x, y, \eta)}{\partial \eta}$$

$$F'(x, y, y) = 2 \cdot \int_{\xi_0}^x \left[\frac{\partial g(\xi, y)}{\partial \eta} \right] \exp(-ikx_0) d\xi \quad (9)$$

Note that integration by parts, or a similar approach, is required in equation (9) for those terms, $\partial g(\xi, y)/\partial \eta$, which contain a singularity in the interval, see reference 1.

Note also, that the spanwise integrand associated with the singular kernel, i.e.,

$$\sqrt{s^2 - \eta^2} \left[f(\eta) \int_{\xi_0}^{\xi_t} g(\xi, \eta) K_s(x_0, y_0, k, M) d\xi + \frac{G(x, y, y)}{y_0^2} - \frac{G'(x, y, y)}{y_0} \right]$$

contains a spanwise logarithmic singularity at the downwash station, which requires log quadrature to be used around a downwash chord for that portion of the spanwise integrand.

This singularity can be removed from the spanwise integrand by subtraction of the term $T_1(x, y) \ln(\beta y_0)^2$ where

$$T_1(x, y) = f(y) \left[\frac{\beta^2}{2} \frac{\partial g(\xi, \eta)}{\partial x} + ik \left(\frac{\beta^2}{2} - 1 \right) g(x, y) - \frac{k^2}{4} G(x, y, y) \right]$$

The downwash effects due to the singularity evaluated in closed form outside the integral are given by (equation (11) of reference 2)

$$\pi T_1(x, y) \left[\frac{s^2}{2} \log \left(\frac{\beta s}{2} \right)^2 - \frac{s^2}{2} + y^2 \right]$$

2.4 KERNEL FUNCTION

The kernel function is an aerodynamic influence function relating the induced normal velocity at an arbitrary field point to a unit loading on a surface at some other point. In the case of a flat plate lifting surface, only the planar portion of the kernel is used. This may be written,

$$K_s(x_0, y_0, k, M) = k^2 e^{-ikx_0} \left\{ -\frac{R + kx_0}{Rk^2 y_0^2} + \frac{i}{R} - \frac{kx_0 - MR}{2\beta^2 R} - \frac{\ln |(R - kx_0)/(2 - 2M)|}{2} \right\} \quad (10)$$

where

$$R = \sqrt{k^2 x_0^2 + \beta^2 k^2 y_0^2}$$

The expression (10) has been shown to contain a number of singularities which cause numerical integration to be extremely expensive. The singularities have been identified and may be analytically subtracted from the full expression yielding a nonsingular function. The form of the singular portion of the kernel is

$$K(x_0, y_0, k, M) = -e^{ikx_0} \frac{1}{y_0} \frac{\partial}{\partial y_0} \int_{-\infty}^h \frac{e^{ik\lambda}}{\sqrt{\lambda^2 + y_0^2}} d\lambda \quad (11)$$

where

$$h = \frac{x_0 - M\sqrt{x_0^2 + y_0^2}}{\beta^2}$$

which reduces to equation (12) when $k = 0$.

$$K_s(x_0, y_0, 0, M) = - \frac{1 + x_0 / \sqrt{x_0^2 + \beta^2 y_0^2}}{y_0} \quad (12)$$

The singular portion is integrated separately from the nonsingular portion. Because of its singular nature, it requires a large number of evaluations when numerical integration is being performed; however, it is relatively inexpensive to evaluate. The nonsingular function is slightly more expensive to evaluate than the full kernel; however, because of its regular nature, it is evaluated much less during numerical integration.

Two forms of the nonsingular kernel are used. The first, Watkin's formulation, is faster to calculate (and numerically sufficiently accurate) for values of $k|y_0| \geq 1.0$. The second, Rosel's formulation, requires longer to calculate (particularly as $k|y_0|$ becomes large), but is numerically more accurate for $k|y_0| \leq 1.0$.

For Watkin's form, defining

$$I_a = \int_0^{\frac{h}{|y_0|}} \left[\frac{\tau e^{ik|y_0|\tau}}{\sqrt{1 + \tau^2}} \right] d\tau \quad (13)$$

The form of the full kernel expression is

$$K(x_0, y_0, k, M) = k^2 e^{ikx_0} \left\{ -K_1(k|y_0|) / k|y_0| - i \frac{\pi}{2} \left[I_1(k|y_0|) - L_1(k|y_0|) \right] / k|y_0| + i/k|y_0| - kx_0 e^{ikh} / k^2 y_0^2 + I_a \right\} \quad (14)$$

The two expressions, equations (11, 14) are combined to give the nonsingular form.

$$K_{ns}(x_0, y_0, k, M) = K(x_0, y_0, k, M) - K_s(x_0, y_0, k, M)$$

In equation (13) the term $\tau / \sqrt{1 + \tau^2}$ is approximated by an exponential series, reference 7, which may be integrated analytically.

For Rosel's form, the nonsingular kernel is written directly,

$$\begin{aligned} K_{ns}(x_0, y_0, k, M) = & k^2 e^{-ikx_0} \left\{ \int_{-kf}^{kh} \left[\left(e^{i\lambda} - 1 - i\lambda + \lambda^2 / 2 \right) / \left(\lambda^2 + k^2 y_0^2 \right)^{3/2} \right] d\lambda \right. \\ & + \int_{-\infty}^{-kf} \left[e^{i\lambda} / \left(\lambda^2 + k^2 y_0^2 \right)^{3/2} \right] d\lambda \\ & + M \left(e^{ikh} - 1 - ikh + k^2 h^2 / 2 \right) / \left(\sqrt{k^2 x_0^2 + \beta^2 k^2 y_0^2} \sqrt{k^2 h^2 + k^2 y_0^2} \right) \\ & + ik / \sqrt{k^2 f^2 + k^2 y_0^2} - 1 / \left[\sqrt{k^2 f^2 + k^2 y_0^2} \left(\sqrt{k^2 f^2 + k^2 y_0^2} + kf \right) \right] \\ & \left. - .5k^2 \left(\ln \left[\left(\sqrt{k^2 f^2 + k^2 y_0^2} + kf \right) / 2 \right] - kf / \sqrt{k^2 f^2 + k^2 y_0^2} \right) \right\} \end{aligned}$$

where the singular terms (the same as in equation (11) are already removed. The exponentials in the integrals are written as infinite series and integrated analytically. The resulting infinite series of terms, which may be calculated in a recursive manner, are truncated when a pre-determined conversion criteria is met.

2.5 LOADING FUNCTIONS

The loading functions used within RHOIV are of two types. The regular, or main surface, pressure terms are used to match the regular boundary condition associated with a simple lifting surface or the residual boundary condition associated with a lifting surface with controls when the control discontinuities have been removed. The singular, or control surface, pressure terms are used to match the change in boundary condition at a control surface *hinge* or *side edge*.

The regular pressure is assumed to be of the form

$$\begin{aligned}\Delta P_r(\xi, \eta) &= 4\rho V^2 \sqrt{s^2 - \eta^2} \sum_m \Delta p(\xi, \eta; m) a(m) \\ &= 4\rho V^2 \sqrt{s^2 - \eta^2} [\Delta p(\xi, \eta; m)]' [a(m)]\end{aligned}$$

where $a(m)$ are unknown coefficients. The term $\sqrt{s^2 - \eta^2}$ has been included in the coefficient to simplify evaluation of the dipole singular portion of the downwash integral expression.

The assumed main surface pressure terms, $\Delta p(\xi, \eta)$, are themselves composed of a “spanwise” and a “chordwise” term, e.g.,

$$\Delta p(\xi, \eta; m) = f(\eta; i) g(\xi, \eta; j) \quad (15)$$

The set of $\Delta p(\xi, \eta)$ is composed of all combinations of spanwise, $f(\eta)$, and chordwise, $g(\xi, \eta)$, terms. For the determined case, the number of spanwise terms is equal to the number of downwash chords (=NSPT), and the number of chordwise terms is equal to the number of points per downwash chord (=NCPT).

The spanwise terms used are

$$f(\eta; i) = \sin[(2 \cdot i - N) \phi] / \sqrt{s^2 - \eta^2}, i = 1, \dots, \text{NSPT}$$

where

$$\begin{aligned}\phi &= \cos^{-1}(\underline{\eta}), \underline{\eta} = \eta/S \\ N &= 1 \text{ for a symmetric analysis,} \\ &= 0 \text{ for an antisymmetric analysis}\end{aligned}$$

The chordwise terms used are

$$g(\xi, \eta; r) = \frac{\cos(r-1)\theta + \cos r\theta}{\sin\theta}, r = 1, 2, \dots, 8$$

where

$$\theta = \cos^{-1}(-\underline{\xi}), \underline{\xi} = [\xi - \xi_m(\eta)] / b(\eta)$$

The (i, j) combinations of Equation (15) are ordered (i = 1, ..., NSPT), j = 1, ... NCPT .

The singular pressure expression associated with a control surface is of the form,

$$\Delta P_s(\xi, \eta) = \rho V^2 \Theta(\eta) g(\xi, \eta) / \pi \quad (16)$$

where as indicated in Equation (4) the streamwise control rotation, $\Theta(\eta)$, is represented as a cubic,

$$\Theta(\eta) = \sum_{l=1}^4 A(l) \eta_{cs}^{l-1}$$

$$\eta_{cs} = (\eta - y_i) / (y_o - y_i)$$

Defining the “spanwise” pressure terms to be,

$$f(\eta; i) = \eta_{cs}^{i-1} / 4\pi \sqrt{s^2 - \eta^2}$$

Equation (16) becomes,

$$\Delta P_s(\xi, \eta) = 4\rho V^2 \sqrt{s^2 - \eta^2} [\Delta p(\xi, \eta; m)]' [A(m)]$$

where $\Delta p(\xi, \eta; m) = f(\eta; i) g(\xi, \eta)$

The “chordwise” portion, $g(\xi, \eta)$, is composed of a pressure term from each side edge,

$$g(\xi, \eta) = g(\xi, \eta, y_o) - g(\xi, \eta, y_i) + S_f [g(\xi, \eta, -y_o) - g(\xi, \eta, -y_i)]$$

where

$$y_o, y_i = \text{Outboard and inboard side edges for right hand side of planform}$$

$$-y_o, -y_i = \text{Outboard and inboard side edges for left hand side of planform}$$

$$s_f = +1 \text{ for a symmetric analysis, } -1 \text{ for an antisymmetric analysis}$$

The terms $g(\xi, \eta, y_s)$ consist of a portion derived, reference 1, in an asymptotic expansion process to satisfy the change in boundary conditions across the hinge and side edge, and modification functions which maintain the necessary singular characteristics at the hinge and side edge but cause the total expression to have the correct characteristics at the planform boundaries. Two boundary value problems are used: (1) partial chord control, (2) full chord control. The partial chord expression is used for all side edges associated with trailing edge controls. The partial chord expression is subtracted from the full chord expression for all side edges associated with leading edge controls.

The spanwise modification function used for both the partial chord and full chord expression is

$$H(\eta) = 1 - C (1 + .5C + .375C^2), C = |\eta - y_s| / |\pm S - y_s| \quad \text{for } |\eta| > |y_s|$$

$$1 - C^3 (10 - 15C + 6C^2), C = |\eta - y_s| / \delta \quad \text{for } |\eta| < |y_s| \quad (17)$$

The following coefficients are used independently of side edge for the partial chord control expression.

$$C_1 = \left[-1 + \frac{k^2}{2} (\xi - \xi_c)^2 - 2ik (\xi - \xi_c) \right] / \beta_H$$

$$C_2 = k^2 (\xi - \xi_c) - 2ik \quad (18)$$

The contribution to $g(\xi, \eta)$ for each partial chord side edge is then,

$$g(\xi, \eta, y_s) = H(\eta) \left[C_1 E_1 M(\xi - x_s, \eta - y_s) + C_2 E_2 (\eta - y_s) N(\xi - x_s, \eta - y_s) \right]$$

where

$$E_1 = \left[\sqrt{(2\xi_c - \xi_\ell - \xi)(\xi - \xi_\ell)} / (\xi_c - \xi_\ell) \right] \left\{ 1 + .5 \left[(\xi - \xi_c) / (\xi_c - \xi_\ell) \right]^2 \right\} \text{ for } \xi < \xi_c$$

$$= 1.0 \text{ for } \xi > \xi_c \quad (19)$$

$$E_2 = \left\{ (\xi - \xi_\ell)^2 (\xi_t - \xi)^2 / \left[(\xi - \xi_\ell)^2 + (\eta - y_s)^2 \right] \left[(\xi_t - \xi)^2 + (\eta - y_s)^2 \right] \right\}^{1/4}$$

$$M(\xi - x_s, \eta - y_s) = \ln \left[R - \left[\beta^2 (\eta - y_s) + (\xi - x_s) \tan \Lambda_H \right] / \beta_H \right] \quad (20)$$

$$N(\xi - x_s, \eta - y_s) = \ln \left[R - (\xi - x_s) \right]$$

and

$$R = \sqrt{(\xi - x_s)^2 + \beta^2 (\eta - y_s)^2}$$

Note that C_1 , C_2 , M , and N were derived using the asymptotic expansion process; E_1 and E_2 are chordwise modification functions.

The following coefficients which are independent of (ξ, η) are side edge dependent in the full chord control expression.

where

$$C_1 = 1 - ik (x_c - x_\ell)$$

$$C_2 = k \left[- (x_c - x_\ell) k M^2 / \beta^2 + i (\beta^2 - M^2) / \beta^2 \right]$$

$$(x_c - x_\ell) = \left[\xi_c(y_s) - \xi_\ell(y_s) \right]$$

The following terms are dependent upon side edge and upon (ξ, η) in the full chord control expression.

$$G_{IS} = E_3 Q_1 \sqrt{\xi - \xi_\ell}$$

$$G_{S1} = E_3 \sqrt{\xi - \xi_\ell} Q_1$$

$$G_{S2} = E_3 \sqrt{\xi - \xi_\ell} (C_1 L_2 + C_2 L_1)$$

where

$$Q_1 = \beta \text{sign}(\eta - y_s) L_1 + \tan \Lambda_L L_2$$

$$L_2 = \sqrt{R - [\xi - \xi_c(y_s)]}$$

$$L = \sqrt{R + [\xi - \xi_c(y_s)]}$$

$$R = \sqrt{[\xi - \xi_c(y_s)] + \beta^2(\eta - y_s)^2}$$

and

$$C_1 = \tan \Lambda_L + ik \left\{ 2 [\xi - \xi_c(y_s)] \tan \Lambda_L - (3\beta_L^2 - 2\beta^2)(\eta - y_s) \right\} / 4\beta^2$$

$$C_2 = 1 + ik^2 (\xi - \xi_\ell(\eta)) / 2\beta^2$$

and the chordwise modification function E_3 is,

$$E_3 = \frac{1}{2} \sqrt{3 - 2\xi - \xi^2}$$

additionally,

$$G_{L1} = (\eta - y_s) \left\{ E_3 \ln \left[(C_1 + C_2)^2 \right] - E_2 \ln \left[\beta_L^2 (\eta - y_s)^2 \right] \right\}$$

$$G_{L2} = \left\{ 1 + ik^2 [\xi - \xi_\ell(y_s) - .75 \tan \Lambda_L (\eta - y_s)] / \beta^2 \right\} G_{L1}$$

where

$$C_1 = L_2^2 - \tan \Lambda_L (\eta - y_s)$$

$$C_2 = \sqrt{2} \sqrt{\xi - \xi_\ell(y_s)} L_2$$

and the chordwise modification function E_2 is

$$E_2 = (\xi_t - \xi)^2 \left\{ (\xi_t - \xi_\ell)^2 + \beta^2 (\eta - y_s)^2 \right\} / (\xi_t - \xi_\ell)^2 \left\{ (\xi_t - \xi)^2 + \beta^2 (\eta - y_s)^2 \right\}^{1/4}$$

and finally,

$$G_{AT} = E_2 \beta \text{sign}(\eta - y_s) \arctan(C_1/C_2)$$

where

$$C_1 = \sqrt{2} \sqrt{\xi - \xi_\ell(y_s)} L_1$$

$$C_2 = L_1^2 + (\eta - y_s) \tan \Lambda_L$$

Note that all terms except E_2 and E_3 were derived using the asymptotic expansion process.

The contribution of each full chord side edge to $g(\xi, \eta)$ is

$$g(\xi, \eta, y_s) = \left[C_{IS} G_{IS} + C_{S1} G_{S1} + C_{S2} G_{S2} + C_{L1} G_{L1} + C_{L2} G_{L2} + C_{AT} G_{AT} \right] \cdot \left[e^{ik^2 M^2 [\xi - \xi_\ell(y_s)] / \beta^2} \right]$$

2.6 DOWNWASH DEFINITION

The left hand side of the downwash integral equation is the kinematic downwash, or kinematic angle of attack, $W(x, y)$. The kinematic downwash, which is derived from the modal displacements for some structural vibration mode, is the boundary condition which must be satisfied by the as yet unknown pressure distribution under the integral equation (5).

The following is applicable for any mode j ; the sub script is omitted. Reference 1 presents a more detailed derivation and explanation.

If the equation of the surface of a general body in a flow field is written, $F(x, y, z, t) = 0$, the condition of no flow through the body is

$$DF/Dt = \partial F/\partial t + (\partial F/\partial x)u + (\partial F/\partial y)v + (\partial F/\partial z)w$$

where DF/Dt is the substantial derivative with respect to time. When the body is a flat plate and undergoing sinusoidal motion,

$$z(x, y, t) = Z(x, y) e^{i\omega t}$$

The velocity normal to the surface, w , can be written.

$$\begin{aligned} w &= - \left[\partial z/\partial t + (\partial z/\partial x)u + (\partial z/\partial y)v \right] e^{i\omega t} \\ &= - \left[(\partial Z/\partial x)u + (\partial Z/\partial y)v + i\omega Z \right] e^{-i\omega t} \end{aligned}$$

Assuming there is no spanwise flow, the kinematic downwash (amplitude ratio), $W = (w/V)e^{i\omega t}$, is

$$W(x, y) = - \left[(\partial Z(x, y)/\partial x) (u/V) + ikZ(x, y) \right]$$

where the term (u/V) , called the *velocity profile*, is identically one for a flat plate. A first order approximation of thickness effects may be introduced using a velocity profile which is not identically one, see reference 3. This modification of the real part of the boundary condition is particularly significant when attempting to calculate control hinge moments for non-flat plate airfoil sections.

The RHOIV program will, at the user's option, generate an additional kinematic downwash column for a gust analysis. The forms available are

$$\begin{aligned} W(x, y) &= [\cos(\Phi) - i \cdot \sin(\Phi)] \\ \Phi &= \left[k(x - x_{\text{ref}}) \right], x_{\text{ref}} = \text{a zero phase gust reference point} \end{aligned}$$

which is referred to as a gradual penetration gust, and

$$W(x, y) = [1 - 0i]$$

which is referred to as a discrete gust.

2.7 SOLUTION FOR UNDETERMINED COEFFICIENTS

In order to solve for the unknown coefficients of the assumed main surface pressure terms, $a(m, j)$, the kinematic downwash, $W(x, y; j)$, is first modified by removing the mathematical downwash, $W^*(x, y, n; j)$, associated with each control surface in the analysis. The resulting residual downwash, $\bar{W}(x, y; j)$, which is smooth and continuous, is used in the set of linear equations which is solved for the unknown coefficients.

$$[\bar{W}(x, y; j)] = [W(x, y; j)] - [W^*(x, y, n; j)]$$

where

$$[W^*(x, y, n; j)] = [C^*(x, y, n; m)] [A(n; m, j)]$$

then

$$[C(x, y; m)] [a(m, j)] = [\bar{W}(x, y; j)]$$

2.8 UNSTEADY PRESSURES, SECTIONAL AND TOTAL GENERALIZED FORCES

The final results generated by the RHOIV program consist of delta pressures and generalized forces. The pressures are determined by evaluating the various pressure terms used at the desired output points and combining with the required coefficients. The generalized forces are determined by integrating pressures times modal displacements for all combinations of modes used. Sectional forces involve integrating along a chord; total forces involve integrating over the area of the planform half span.

All program output has the coefficient of $q = 0.5\rho V^2$.

The pressure at any point (ξ, η) for some mode j is composed of a contribution from the assumed main surface pressure terms and a contribution from the pressure terms associated with each control surface.

$$\Delta P(\xi, \eta; j) = \Delta P_r(\xi, \eta; j) + \sum_n \Delta P_s(\xi, \eta, n; j)$$

where

$$\begin{aligned} \Delta P_r(\xi, \eta; j) &= 4\rho V^2 \sqrt{S^2 - \eta^2} \left\{ \Delta p(\xi, \eta; m) \right\}' \left\{ a(m, j) \right\} \\ &= \text{contribution from assumed from main surface pressure terms} \end{aligned}$$

$$\begin{aligned} \Delta P_s(\xi, \eta, n; j) &= 4\rho V^2 \sqrt{S^2 - \eta^2} \left\{ \Delta \bar{p}(\xi, \eta, n; m) \right\}' \left\{ A(n; m, j) \right\} \\ &= \text{contribution from control surface } n \text{ pressure terms} \end{aligned}$$

Note that the terms $\Delta p (\xi, \eta; m)$ can be calculated independently of k value and Mach number. The program output for pressures, $\Delta P (\xi, \eta; j)/q$, has dimensions of (modal displacement units)/(planform length units).

The sectional forces at a spanwise station η for the combination of i displacement mode and j pressure mode are also composed of contributions from main surface and control surface pressure terms.

$$Q^S (\eta; i, j) = \int_{\xi_\ell}^{\xi_t} Z(\xi, \eta; i) \Delta P (\xi, \eta; j) d\xi \quad (21)$$

$$[Q^S (\eta; i, j)] = [Q_r^S (\eta; i, j)] + \sum_n [Q_s^S (\eta; n; i, j)]$$

where

$$[Q_r^S (\eta; i, j)] = [\bar{Q}^S (\eta; i, m) a(m, j)]$$

= contribution from assumed main surface pressure terms

$$[\bar{Q}_r^S (\eta; i, m)] = 4\rho V^2 \sqrt{S^2 - \eta^2} \int_{\xi_\ell}^{\xi_t} Z (\xi, \eta; i) \Delta p (\xi, \eta; m) d\xi$$

Note that \bar{Q}_r^S may be calculated independently of k value and Mach No.

$$[Q_s^S (\eta, n; i, j)] = 4\rho V^2 \sqrt{S^2 - \eta^2} \left[\int_{\xi_\ell}^{\xi_t} Z (\xi, \eta; i) \Delta \bar{p} (\xi, \eta, n; m) d\xi \right] \cdot [A(n; m, j)]$$

= contribution from control surface n pressure terms

The program output for sectional forces, $[Q^S (\eta; i, j)] / q$, has dimensions of (modal displacement units)².

Similarly, the total generalized forces are given by

$$Q(i, j) = \int_0^S \int_{\xi_\ell}^{\xi_t} Z (\xi, \eta; i) \Delta P (\xi, \eta; j) d\xi d\eta \quad (22)$$

$$[Q(i, j)] = [Q_r(i, j)] + \sum_n [Q_s(n; i, j)]$$

where

$$[Q_r(i, j)] = [\bar{Q}_r(i, m)] [a(m, j)]$$

= contribution from assumed main surface pressure terms

$$\bar{Q}_r(i, m) = 4\rho V^2 \int_0^S \int_{\xi_\ell}^{\xi_t} \sqrt{S^2 - \eta^2} Z(\xi, \eta; i) \Delta p(\xi, \eta; m) d\xi d\eta$$

Note that \bar{Q}_r may be calculated independently of k value and Mach No.

$$[Q_s(n; i, j)] = 4\rho V^2 \left[\int_0^S \int_{\xi_\ell}^{\xi_t} \sqrt{S^2 - \eta^2} Z(\xi, \eta; i) \Delta \bar{p}(\xi, \eta, n; m) d\xi d\eta \right] \cdot$$

[A(n; m, j)]

= contribution from control surface n pressure terms.

The program output for total forces, $[Q(i, j)]/q$, has the dimensions of (planform length units) (modal displacement units)².

3.0 COMPUTER PROGRAM USAGE

3.1 MACHINE REQUIREMENTS

The RHOIV program system is written for the CDC 6000 series computer. It requires the use of a card reader, line printer, disk storage, a minimum of zero and a maximum of five tape drives.

3.2 OPERATING SYSTEM

The program runs under the SCOPE 3.1 or NOS operating systems. All system routines used are assumed to be standard CDC release. With the exception of COMPASS routines used for shifting and vector inner products, all source routines are coded in CDC 6600 FORTRAN IV. The overlay loading feature is used.

3.3 STORAGE ALLOCATION

The RHOIV program will load under a field length of 61700g. This estimate is based on FTN compilation (OPT=2) under NOS 1.2 and may vary for other systems or other levels of optimization.

The program has been written to use blank common as a working area for those portions of the analysis which are dependent upon the size of the user's problem. Specifically, there is no program limitation on the number of modes, modal input points, pressure output points, or sectional force output chords.

The minimum core requirement of 72600g words is determined by C-matrix calculation in which variable dimensioning is not used, and is also system dependent.

The requirements for the other sections will be calculated and printed at execution time; they may be precalculated using the formulae below. Some examples of required field lengths for selected problems are given following the equations. Note only those sections which will be used need be considered.

The following variables are used in describing core requirements:

- | | |
|--------------|--|
| 1. NOVP | Number of user supplied velocity profiles |
| 2. NVPP (I) | Number of points associated with velocity profile I. (Refer to user input, page 47). |
| 3. NPRC | Number pressure output chords |
| 4. NPPT | NPRC*NPPRC |
| 5. NSGFC | Number of sectional force output chords (Refer to user input, page 49. Note that default values may be supplied by the program.) |
| 6. NOCS | Number of control surfaces |
| 7. NIPTS (I) | Number of modal input points for zone I |
| 8. MIPTS | Max [NIPTS (I), I=1, NOCS+1] |
| 9. NZONES | Number of modal input zones, =NOCS+1 |
| 10. NDMDS | Number of displacement modes |

- | | |
|------------|---|
| 11. NPMDS | Number of pressure modes
= NDMDS if .NOT.GUST
= NDMDS+1 if GUST
(Refer to user input, page 50) |
| 12. NDWP | Number of downwash points = NDWC*NPDWC |
| 13. NPTRM | Number of assumed main surface pressure terms
(=NDWP currently)
(Refer to user input, page 48) |
| 14. LIIA | Length of IIA information |
| 15. LVP | Length of velocity profile information |
| 16. LCCR | Length of control rotation information |
| 17. MPCHD | Maximum number of points/chord required for sectional or total generalized forces |
| 18. MICH | Maximum number of chords required for generalized force integration |
| 19. LINDEX | Length of CMFILE index (Refer to discussion below) |
| 20. MNPMOC | Maximum number of points/chord for printed modal output |
- (1) The interpolation information arrays are used to calculate control rotation coefficients, basic downwash matrix, and sectional and total generalized force precalculated information. The length involved is,
- (a) LIIA = The sum of the lengths of all IIA arrays input by user (IIAIN=.TRUE.), or
- (b) $LIIA = NZONES*(3*NDMDS+23) + (NDMDS+4)*\sum_{I=1,NZONES} NIPTS(I)$
- (2) If controls are present, control rotation coefficients are used in all preparation routines. The length involved is,
- $$LCCR = 4*NOCS*NDMDS$$
- (3) If velocity profiles are used, cubic splines are generated for each profile, and the information used in calculation of control rotations and the basic downwash matrix.
- $$LVP = 5*\sum_{I=1,NOVP} NVPP(I) - NOVP$$
- (4) For the purpose of performing sectional and total generalized force integration, maximums can be placed on the number of integration chords and points/chord which will be required. The maximum number of points/chord required for sectional or total generalized force integration is,
- $$MPCHD = 22 + (4*NOCS+12) \text{ if } NOCS > 0$$
- The maximum number of chords required for total generalized force integration is,
- $$MICH = 17 + 8*NOCS$$

- (5) If a user supplied CMFILE is present, a CMFILE index is required. The length of a CMFILE index is,

$$\text{LINDEX} = 13 * \text{No. Main Surface C-matrices} + \text{No. Control Surface C-matrices}$$

A minimum for each of the sections is given, followed by additive amounts for each subsection. The core required is the maximum required for any section used. The requirement for a section is the section minimum plus maximum required for any subsection used.

3.4 TIMING

The central processor time required to execute any problem is almost entirely dependent upon the number of C-matrices which must be calculated. A large (>90%) reduction in CP (central processor) time may be gained by utilizing previously generated C-matrices (refer to section 3.5.2).

The principle factors in the CP time required to calculate a C-matrix are (1) the number of downwash points, (2) whether the matrix is associated with the main surface, a trailing edge control surface, or leading edge control surface, and (3) whether the condition is steady state ($k=0$), or unsteady ($k \neq 0$).

Items (2) and (3) plus planform shape and position of a downwash point on the planform will determine the CP time required for each downwash point. The values given below are average requirements for the sample problem of section 3.9.

<u>SURFACE</u>	<u>CONDITION</u>	<u>CP SECONDS/DOWNWASH PT.</u>
MAIN	k = 0	.15
	k > 0	.42
TRAILING EDGE CONTROL	k = 0	.20
	k > 0	.60
LEADING EDGE CONTROL	k = 0	.40
	k > 0	.95

The above values may be used initially to estimate CP time required for a users problem. Note that a C-matrix must be calculated or retrieved from a library for the main surface and each control surface in the problem for each condition. At execution time the RHOIV program prints the specific CP time required per downwash point for any C-matrix calculated as well as printing a breakdown of CP usage by the various other sections of the program.

3.5 FILE I/O

3.5.1 FILE UTILIZATION

RHOIV uses standard input and output, two internal scratch files, and up to five (5) user specified input/output files. The scratch files are referenced in the program by different names, dependent upon the usage. All user input/output files have the record format described below for READM/WRITEM.

The files referenced are:

- (1) INPUT Standard input (BCD)
- (2) OUTPUT Standard output (BCD)
- (3) RHOSC1 Scratch file (binary)
- (MISFILE) Modal input scratch file
- (RESFILE) Result scratch file
- (4) RHOSC2 Scratch file (binary)
- (INSFILE) Input scratch file
- (CMSFILE) C-matrix scratch file
- (COFFILE) Coefficient file
- (5) MIFILE Modal input file, user specified file for input modal displacements and associated points (binary)
- (6) CMFILE C-matrix file, user specified input/output file containing the library of previously calculated C-matrices (binary)
- (7) DPFILE Pressure output file, user specified output file containing all unsteady pressure results
- (8) SGFFILE Sectional force output file, user specified output file containing all sectional force results

- (9) GFFILE Generalized force output file, user specified output file containing all generalized force results

Note that the user specifies the file names for (5) – (9) in data input. Files (5), (7) – (9) may be equivalenced in any combination using one or more file names, the output for (7) – (9) will then be interleaved on a k-value, Mach number condition basis.

If a CMFILE is defined it must be discrete.

The user may also specify an initial file position for (5) – (9). MIFILE is positioned and used, then DPFIL, SGFFIL, and GFFIL are positioned, *in that order*. Therefore, if a user gives two or more files the same name, the initial file position specified for the last in the above sequence would be used.

All input/output files use a two record format for each array written. Routines READM and WRITEM are used to read and write these records.

READM/WRITEM FORMAT

Record 1 – ID Record	Word 1	– 5HMATIO
	2	– MROW = Row length of array
	3	– MCOL = Column length of array

3.5.2 C-MATRIX LIBRARY

The C-matrix library, maintained on a user specified I/O file, CMFILE, consists of a two file set. File 1 consists of all saved C-matrices written sequentially in the order saved. File 2 consists of an index of File 1. If the user specifies a CMFILE, the index is examined for a match each time a C-matrix is required. If a match is found the desired C-matrix is accessed and used. If a match is not found, the desired C-matrix is calculated, the index updated, and the new C-matrix and updated index are written to CMFILE. If a legitimate index is not found on the first attempt to access information in an execution, the specified file is assumed to be a new file; an initial null index will be generated and execution will continue. There is no program limit on the number of C-matrices in the library.

All arrays on CMFILE are written and read using READM/WRITEM.

The CMFILE index consists of a list of entries associated with each C-matrix sufficient to allow testing for a match on a retrieval attempt. Note that the user must utilize MSID in input to differentiate between main surface planforms, and CSID to differentiate between control surfaces associated with a main surface planform. A main surface entry in the INDEX consists of 13 words, and contains a counter for the number of associated control surface entries which follow. A control surface entry consists of one word; it can only be referenced through its associated main surface entry.

MAIN SURFACE ENTRY

Word	Bits	Var. type	Variable	Description
1	59-18	H	MSID	Main surface ID
	14-00	I	MATPOS	Position of matrix in file CMF1
2	35-30	I	SYM	Symmetry indicator
	29-24	I	NDWC	No. downwash chords
	23-18	I	NPDWC	No. points/downwash chord
	17-12	I	NSPT	No. spanwise main surface pressure terms
	11-6	I	NCPT	No. chordwise main surface pressure terms
	5-0	I	NCSE	Number of associated control surface entries
3		R	S	Semi-span
4		R	KVAL	ω/V — reduced frequency
5		R	MACH	M — mach number
6		H	DATE	Entry date
7-13		H	RTITLE	Entry run title

CONTROL SURFACE ENTRY

Word	Bits	Var. type	Variable	Description
1	59-18	H	CSID	Control surface ID
	17-15	I	CSTYPE	Control surface type
				Full span
				Tip span
				Mid span
				Partial span
				Leading edge or Trailing edge
	14-00	I	MATPOS	Position of matrix in file CMF1

New main surface entries are appended to the bottom of the index. New control surface entries are inserted below the last previous control surface entry of its associated main surface entry.

3.5.3 FILE FORMATS

All files, with the exception of INPUT and OUTPUT are described in this section; the order is alphabetical.

A file name, equivalent name, file type, and short description of usage are given in addition to record formats.

With respect to the headings, the following applies,

- | | |
|------------------------------|---|
| (1) REC. NO. | RECORD NO. OR IDENTIFIER |
| (2) REPETITION | AN INTEGER SPECIFYING THE NUMBER OF IMMEDIATE REPETITIONS OF THE RECORD. REPETITIONS OF SETS OF RECORDS ARE DESCRIBED PRIOR TO THE SET. |
| (3) VARIABLE
(DIMENSIONS) | PROGRAM, INPUT, OR OUTPUT VARIABLE NAME

NUMBER OF ELEMENTS ASSOCIATED WITH THE VARIABLE. NOTE THAT ALL ARRAYS ARE WRITTEN IN CDC6000 STORAGE ORDER, E.G.,

$A(I,J,K) \quad (((A(i,j,k),i=1,I),j=1,J),k=1,K)$ |
| (4) T | TYPE OF INFORMATION
I – INTEGER
R – REAL
C – COMPLEX (NO. TERMS=2*FIRST DIMENSION)
H – HOLLERITH
M – MIXED |
| (5) DESCRIPTION | DESCRIPTION OF INFORMATION BY VARIABLE |

The following variable names are used in describing DIMENSIONS.

- | | |
|------------|---|
| 1. NOCS | NUMBER OF CONTROL SURFACES |
| 2. NOV | NUMBER OF VELOCITY PROFILES |
| 3. NDWP | NUMBER OF DOWNWASH POINTS |
| 4. NPTRM | NUMBER OF ASSUMED MAIN SURFACE PRESSURE TERMS
(=NSPT*NCPT, in most cases = NDWP) |
| 5. NDMDS | NUMBER OF DISPLACEMENT MODES |
| 6. NPMDS | NUMBER OF PRESSURE MODES (EITHER NDMDS OR NDMDS+1) |
| 7. NOKVAL | NUMBER OF REDUCED FREQUENCIES |
| 8. NOMACH | NUMBER OF MACH NUMBERS |
| 9. NOCOND | NUMBER OF CONDITIONS = NOKVAL*NOMACH |
| 10. NPRC | NUMBER OF PRESSURE REPORT CHORDS |
| 11. NPPRC | NUMBER OF POINTS/PRESSURE REPORT CHORD |
| 12. NPPT | NUMBER OF PRESSURE OUTPUT POINTS = NPRC*NPPRC |
| 13. NSGFC | NUMBER OF SECTIONAL FORCE OUTPUT CHORDS |
| 14. NPZONE | NUMBER OF INPUT POINTS/MODAL INPUT ZONE |
| 15. LINDEX | LENGTH OF CMFILE INDEX |

File name:		CMFILE	File type:		SEQUENTIAL BINARY
CMFILE is a user specified INPUT/OUTPUT file generated and used by the RHOIV program as a library of previously calculated C-matrices. It is a multifile file; the first file is the set of all saved C-matrices, the second is an index of the first. Routines READM/WRITEM are used to READ/WRITE the file.					
Rec. no.	Repetition	Variable (dimensions)	T	Description

File name:		INSFILE (=RHOSC2)	File type:		SEQUENTIAL BINARY
INSFILE is a sequential binary file used internally by RHOIV. It is generated by various input routines and used by the various preparation routines IIACAL, CRCOEFF, RESPREP, VPRDR.					
Rec. no.	Repetition	Variable (dimensions)	T	Description	
Record set 1 occurs if NOVP>0, and is repeated NOVP times.					
1A	1	YVP NVPP	R I	STATION AT WHICH A VELOCITY PROFILE IS DEFINED NUMBER OF POINTS AT WHICH VELOCITY PROFILE IS SPECIFIED	
1B	1	XVP (NVPP) CVP (4,NVPP-1)	R R	VELOCITY PROFILE POINT CUBIC COEFFICIENTS IN XVP DEFINING PROFILE	
Record set 2 occurs if any pressure results have been requested, i.e., if DPPRT≠0, or DPFILE≠0.					
2A	1	YPRC (NPRC)	R	PRESSURE REPORT CHORDS	
2B	1	XPPT (NPPT)	R	PRESSURE REPORT POINTS	
Record set 3 occurs if any sectional force results have been requested, i.e., if SGFPRT≠0, or DPFILE≠0.					
3	1	YSGFC (NSGFC)	R	SECTIONAL FORCE OUTPUT CHORDS	
Record set 3.1 occurs if the user has specified any interpolated modes output points.					
3.1	NMOC	YMOC NPMOC XPMOC (NPMOC)	R I R	Y-value of a user modal output chord Number of points/modal output chord X-value of points on modal output chord	
Record set 4 occurs unless IIAIN=.TRUE., i.e., unless interpolation information arrays have been input directly. The record set is repeated once for each input zone, i.e., NOCS+1 times.					
4A	1	NPZONE X (NPZONE)	I R	NUMBER OF INPUT POINTS IN ZONE X VALUES OF INPUT POINTS	
4B	NDMDS	Z (NPZONE)	R	MODAL DISPLACEMENTS AT INPUT POINTS FOR ONE MODE	
Record set 5 occurs if any user input of control rotation information has been indicated, i.e., NOCS ≠0 AND CRI (I) ≠0 for some I = 1,NOCS. The record set is repeated for each CRI (I) ≠0.					
5	1	CCR (4,NDMDS)	R	CUBIC COEFFICIENTS OF CONTROL ROTATION, i.e., DELTA ∂Z/∂X AT SPECIFIED HINGE POINTS	

File name:		MIFILE		File type:		SEQUENTIAL BINARY	
MIFILE is a user specified input file which is used to provide modal input points and displacements to RHOIV from disk or tape. Routine WRITEM or an equivalent should be used to generate the ID record and value record.							
Rec. no.	Repetition	Variable (dimensions)	T	Description			
MIFILE may consist of either records 1A,B and 2A,B or 3A,B. If IIAIN=.T. in input, records 3A,B should be used. Otherwise use 1A,B, 2A,B.							
The set 1A,B,2A,B may occur once or 1+NOCS times. In the latter case, assuming NOCS≠0, the modal input points and displacements are associated with the main surface, and control surfaces in the order defined in input.							
1A	1	READM/WRITEM ID INFO (4) USER ID (10)	M	REFER TO PAGE 28 A USER ID OF UP TO 10 WORDS MAY BE INCLUDED. THE ID IS NOT USED BY RHOIV			
1B	1	XY (NPZONE,2)	R	MODAL INPUT POINTS			
2A	1	READM/WRITEM ID INFO (4) USER ID (10)	M	REFER TO PAGE 28 A USER ID OF UP TO 10 WORDS MAY BE INCLUDED. THE ID IS NOT USED BY RHOIV			
2B	1	Z (NPZONE,NDMDS)	R	MODAL DISPLACEMENTS AT INPUT POINTS			
NOTE: If there is only one input zone, i.e., NOCS=0, or if points for all zones are being input in the same block, NPZONE should be the total number of input points. Otherwise NPZONE should be the number of input points for the particular zone.							
Set 3A,B is used if IIAIN=.T., in which case the pair 3A,B should be repeated for each input zone, i.e., 1+NOCS times.							
3A	1	READM/WRITEM ID INFO (4) USER ID (10)	M	REFER TO PAGE 28 A USER ID OF UP TO 10 WORDS MAY BE INCLUDED. THE ID IS NOT USED BY RHOIV			
3B	1	IIA (NIIA)	R	INTERPOLATION INFORMATION ARRAY, NIIA=NO. ELEMENTS IN ARRAY			

File name:		MISFILE (=RHOSC1)	File type:		SEQUENTIAL BINARY
MISFILE is a sequential binary file used internally by RHOIV. It is generated by MIINCK or IIACAL and read by IIARDR in the preparation prior to the k-value, Mach no. cycle.					
MISFILE will be used if any modes exist.					
Rec. no.	Repetition	Variable (dimensions)	T	Description	
1	NOCS+1	NIIA IIA (NIIA)	I R	NUMBER OF IIA ELEMENTS INTERPOLATION INFORMATION ARRAY FOR AN INPUT ZONE	
Record Set 2 occurs if any control surfaces exist					
2	NOCS	CCR (4,NPMDS)	R	CUBIC COEFFICIENTS OF CONTROL ROTATION	

File name: RESFILE (=RHOSC1)		File type: SEQUENTIAL BINARY		
RESFILE is a sequential binary file used internally by RHOIV. It is generated by the various preparation routines, DWPREP, PRSPREP, SGFPREP, and GFPREP, prior to the K-value, Mach no. cycle, and used by the solution and result routines, PCMDWM, SOLUTON, FORMDP, FORMQS, and FORMQ, during the condition cycle.

3.6 CONTROL CARDS

There are basically four modes of execution, from

- a. Source in source form;
- b. Source in UPDATE form;
- c. Relocatable binary;
- d. Absolute binary.

In the following, use of specific control cards has been avoided; rather the required sequence of operations is specified. All file names with the exception of RHOIV, are arbitrary. Note that all overlays have the name RHOIV, thus a file RHOIV is generated at load time. For the cases above

- a.(1) Obtain a source file, PROG (2 records, from permanent storage (cards, tape, permanent disk file, etc.).

- (2) Compile first record placing relocatable binary on BPROG.

- (3) Compile second record placing relocatable binary on BSUBS.

- (4) Generate an alternate library on SUBLIB from BSUBS.

- (5) Load BPROG using alternate library SUBLIB.

- (6) Execute from RHOIV.

*NOTE: On some systems, steps 4 and 5 of a. may be combined into one operation, e.g., loading BPROG using BSUBS directly as an alternate LIBRARY. On other systems in which the loader has no alternate library capability, a preload operation may be performed in which some program other than the loader searches for references in the routines in BPROG to routines in BSUBS generating a file LPROG, is then processed by the loader (i.e., the above program performs the alternate library function).

- b.(1) Obtain an old program library file, OLDPL, from permanent storage.

- (2) Using UPDATE generate a source file, PROG (2 records). (In UPDATE terminology, PROG would correspond to the COMPILE file.)

- (3) Proceed with steps 2 — 6 of a.

- c.(1) Obtain a relocatable binary file, BPROG, main routines, from permanent storage.
- (2) Obtain a relocatable binary file, BSUBS, alternate library subroutines, from permanent storage.
- (3) Proceed with steps 4 – 6 of a.
- d.(1) Obtain an absolute binary file, RHOIV, from permanent storage.
- (2) Execute from RHOIV.

3.7 PROGRAM INPUT

3.7.1 GENERAL REMARKS

The input to RHOIV consists of both BCD input, e.g., cards, and binary, e.g., CMFILE or MIFILE. The card input includes planform description, definition of user I/O files, printed output specifications, list of k-values and Mach numbers and modal input description. Card input may also include velocity profile definitions, the distributions of downwash points, pressure output points, and sectional force output chords, and modal displacements with associated points. The binary input may consist of a library of C-matrices, and modal displacements with associated points or interpolation information arrays.

The card input consists of field dependent input and free field input. The field dependent input is identified in the field column of data stacking as a specific field (number) with associated format or as a LIST indicating sequential input per the FORMAT using as many cards as required. The free field input is identified by NAMELIST in the field column with associated list name in the FORMAT column. Some of the features of namelist input are:

- (1) Card(s) field consists of columns 2 through 80,
- (2) List consists of a \$ list name in column 2 followed by a series of specifications continued on as many cards as required and terminated by a \$.
- (3) Specifications are of the form:
 - (1) Vname = Value
 - (2) Vname(1) = Value1, Value2, . . ., Valuen

Where Vname is one of the variable names for the list, value is the associated value(s). Value may be an integer, a floating point number in normal or exponential form, or in the case of a logical variable of the form.

.T. or .True. indicating true

.F. or .False. indicating false

- (4) Specifications must be separated by commas. NOTE there is no comma between the last specification and terminating \$.

- (5) Embedded blanks are allowed except within the \$ list name, variable name, or value. Note at least one blank must separate the \$ list name and the first specification.
- (6) The order of appearance of variables on the card(s) is not important—the spelling is.
- (7) Any or all of the variables may be left out of the list, e.g., \$list name . . \$ is legitimate. This assumes of course that there is a legal default value associated with the variable(s) not included in the list.

There are a number of input sets consisting of x and y locations on the planform. Where feasible, the option of specifying this information in physical or local non-dimensional coordinates (bar notation) has been allowed.

3.7.2 LIMITATIONS

The following are size limitations within the program (also noted in Data Stacking):

$2 \leq NLE \leq 10$	No. leading edge definition points
$2 \leq NTE \leq 10$	No. trailing edge definition points
$0 \leq NOCS \leq 6$	No. control surfaces
$1 \leq NDWC \leq N$	No. downwash chords, $N=72/ NPDWC $
$1 \leq NPDWC \leq 8$	No. Pts. per downwash chord
$1 \leq NOKVAL \leq 20$	No. reduced frequencies
$1 \leq NOMACH \leq 20$	No. mach numbers

The following are analysis limitations:

No downwash chord should be placed at the tip or control surface side edge. In general downwash chords should satisfy $|y - \eta_s| \geq .02S$ where η_s is the tip or a control side edge.

It is not recommended that a downwash chord be placed at or near a spanwise planform discontinuity, e.g., a change in leading edge or trailing edge slope.

No downwash point should be placed at the leading edge, trailing edge, or control surface hinge.

The downwash point distribution should be such that the boundary conditions are sufficiently defined. (A downwash point on a control surface is not specifically required.)

No pressure report chord or sectional generalized force report chord should be placed at a control surface side edge.

No pressure report point should be placed on a control surface hinge.

	3	21-30	I10	L2	Secondary level overlay no.

3.8 PROGRAM OUTPUT

3.8.1 PROGRAM RESULTS

Printed output of program results consists of an initial block of information reflecting the user's input, followed by those intermediate and final results specified in card set 4, Printed Output Definition. The output controlled by card set 4 is calculated for each k-value Mach number condition; the user may elect to have all, none, or some first n conditions printed.

The intermediate output consists of downwash matrices, C-matrices, and coefficients of assumed main surface pressure terms. If C-matrix printout is specified and control surfaces exist, the C-matrices for all controls as well as the main surface pressure terms are printed. If downwash matrix printout is specified and control surfaces exist, the residual downwash as well as full downwash will be printed. Note that the output of full and residual downwash is cyclic, four modes at a time.

The final results consist of unsteady pressures, sectional and total generalized forces. Generalized force output consists of a single matrix per condition. Sectional force output consists of a matrix per sectional force chord (in the order specified) per condition. Unsteady pressure output consists of real/imaginary and amplitude/phase per output point (in the order specified) written two modes at a time for all pressure modes per condition.

Following all condition output, a summary of the CMFILE index is given if CMFILE is present. Finally, a summary of maximum core required and central processor time used is given.

All normal output includes the user's run title with date appended and k-value and Mach number identified (if applicable).

Binary output from the program consists of all unsteady pressure results if DPFIL≠0, all sectional force results if SGFFIL≠0, and all generalized force results if GFFIL≠0. The form of the information is described in section 3.5 (note that a user may have all binary output placed on the same file, in which case the results are interspersed on a condition basis).

3.8.2 PROGRAM DIAGNOSTICS

Program diagnostics may occur during input preparation or execution of the problem. The RHOIV input processor attempts to read and check all user input, identifying as many data errors as possible. If any errors are discovered during input processing the execution is terminated following input. Errors which may be discovered include:

- (1) exceedance of program size restrictions,
- (2) illegal planform definition,
- (3) illegal distribution of points on the planform,
- (4) inaccurate file specifications

- (5) illegal k-values or Mach numbers
- (6) insufficient modal input definition.

With one specific exception, if a user's input is processed with no errors, and sufficient memory allocation is provided, the job should be completed without user origin errors. If any errors do occur they should be of program or system origin.

The exception to the above can occur during C-matrix calculations. If a downwash chord is placed too close to the planform tip or a control surface side edge, the chordwise integration grid routine CGRID may generate an illegal sequence of integration regions. If the condition $\epsilon = \frac{3.76|Y_o|}{S} < .001$ occurs, a warning message will be printed to indicate a possible problem may occur for a particular integration chord. The condition will occur anytime a downwash chord is less than .02S from the tip or a control side edge.

The message does not indicate an error, only the fact that the above condition has not been met.

The following is a list of input processor diagnostics; the input numbers used are examples.

PLANFORM DEFINITION ERROR:

1. Illegal no. leading edge defn. pts. ($2 \leq NLE \leq 10$), NLE = 11
2. Illegal no. trailing edge defn. pts. ($2 \leq NTE \leq 10$), NTE = 11
3. Illegal no. control surfaces ($0 \leq NOCS \leq 6$), NOCS = 7
4. Illegal no. velocity profiles ($0 \leq NOVPP$), NOVPP = -1
5. YLE(1) \neq YTE(1)
6. YLE(NLE) \neq YTE(NTE)
7. Illegal leading edge definition, YLE not strictly increasing
8. Illegal trailing edge definition, YTE not strictly increasing
9. Leading edge and trailing edge intersect
10. Control surface 1 does not lie within defined planform
11. Control surfaces 2 and 1 are incompatible
12. Velocity profile stations are not strictly increasing
13. Illegal no. of velocity profile points for station 1 ($2 < NVPP$), NVPP = -1
14. Velocity profile points, XVP, for station 1 are not strictly increasing
15. *** SCAMP4 *** error *** on velocity station 1 non user error

FILE DEFINITION ERROR:

1. File spacing error 4, encountered for initial position of DPFILE
2. CMFILE name is not discrete

PLANFORM DISTRIBUTION ERROR:

1. Illegal no. downwash chords, ($1 \leq \text{ABS}(\text{NDWC} * \text{NPDWC}) \leq 72$), $\text{NDWC} = -10$
2. Illegal no. points/downwash chord, ($1 \leq \text{ABS}(\text{NPDWC}) \leq 8$), $\text{NPDWC} = 10$
3. Downwash point 1, not on defined planform
4. Downwash chord 1, coincides with a control surface side edge
5. Downwash point 2, coincides with a control surface hinge
6. Downwash points no. 2 and no. 1, are coincident
7. Pressure report chord 1, not on defined planform
8. Pressure report point for chord no. 1, not on planform
9. Pressure report point 1, coincides with a control hinge
10. Pressure report chord 1, coincides with a control side edge
11. Sectional force report chord 1, not on defined planform
12. Sectional force report chord 1, coincides with a control side edge

CONDITION DEFINITION ERROR:

1. Illegal no. k-values, ($0 < \text{no. KVAL}$)
2. Illegal no. Mach nos., ($0 < \text{no. MACH}$)
3. Illegal k-value, ($0 \leq \text{KVAL}$)
4. Illegal Mach no., ($0 \leq \text{MACH} < 1.0$)

MODAL INPUT DEFINITION ERROR:

1. Illegal no. displacement modes, ($0 \leq \text{NDMDS}$), $\text{NDMDS} = -3$
2. Illegal no. input points, ($3 \leq \text{NIPTS}$), $\text{NIPTS} = 2$
3. Insufficient input pts. in zone 1, ($3 \leq \text{NPZONE}$), $\text{NPZONE} = 2$
4. Input pts. no. 2 and no. 3, are coincident
5. File spacing error 1, on MIFILE
6. I/O error $\text{MROW} < \text{MROWS}$ on MIFILE while reading X,Y for zone 1
7. I/O error $\text{MROW} < \text{MROWD}$ on MIFILE while reading Z for zone 1
8. I/O error $\text{MROW} < \text{MROWD}$ on MIFILE while reading IIA for zone 1

3.9 SAMPLE INPUT/OUTPUT

The following input data, NASA TM X-2909 (see ref. 8) figure 4, is for the lifting surface shown in figure 5, page 76. A portion of the output generated by this data case is given on pages 58-85.

4.0 COMPUTER PROGRAM DESCRIPTION

This section is a description of the organization and function of the various routines included in the RHOIV package.

4.1 OVERLAY STRUCTURE

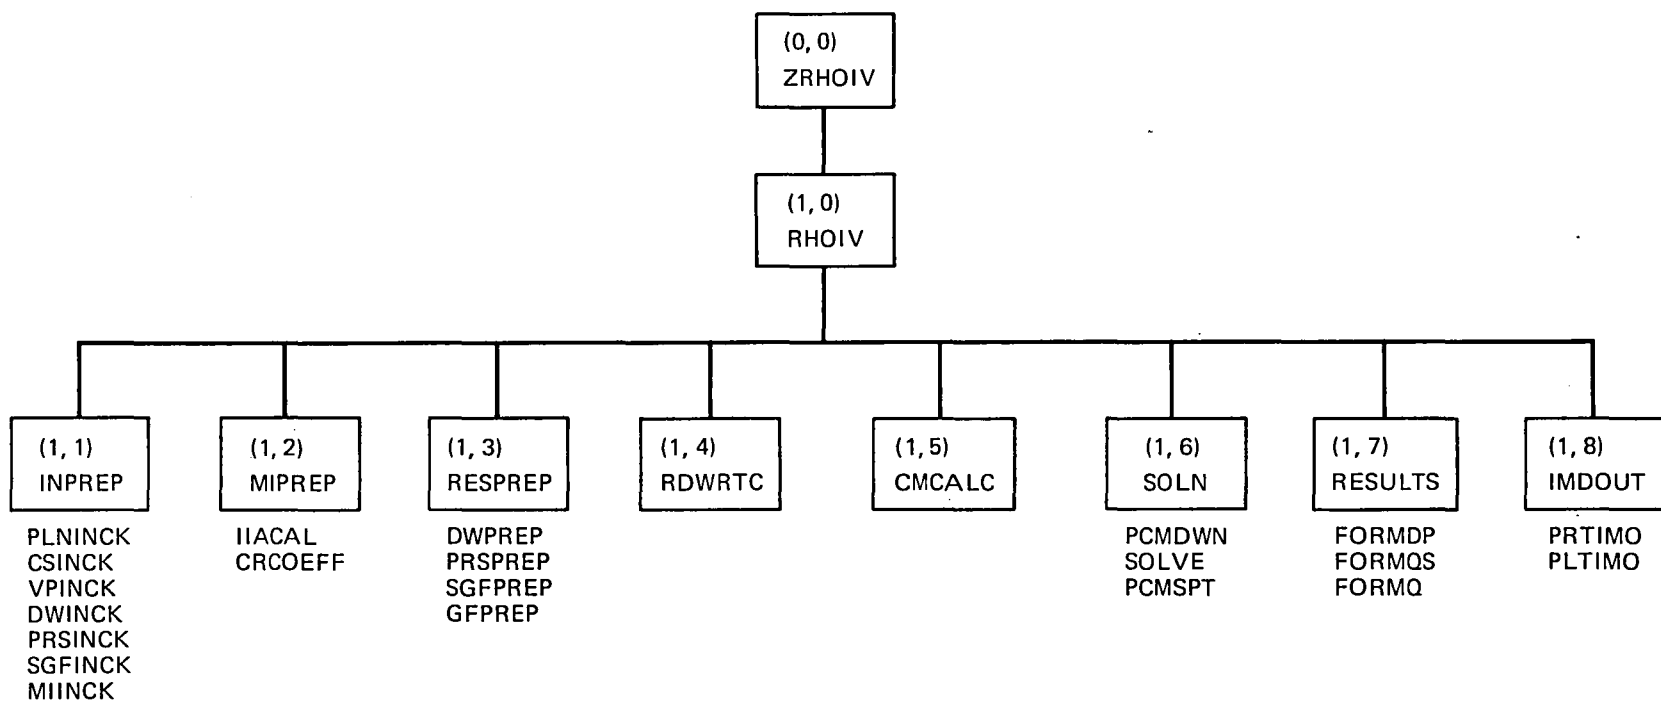

The RHOIV program consists of a (0,0) level overlay, a primary level overlay, and several secondary level overlays.

The (0,0) overlay, program ZRHOIV, is trivial consisting only of a loop on a call to the primary. Any other (0,0) level overlay could be substituted for ZRHOIV with the requirement that blank common not be mentioned.

The primary level (1,0) overlay, program RHOIV, is the driver for the RHOIV system, figure 6. Secondary level overlays are selected by RHOIV to perform a logical step in the user's analysis.

The overlay structure is:

(1)	(RHOIV,0,0)	ZRHOIV,	Calls overlay (RHOIV,1,0)
(2)	(RHOIV,1,0)	RHOIV,	Calls secondary level overlays to read input, prepare data, calculate results.
(3)	(RHOIV,1,1)	INPREP,	Reads and checks all user input.
	(RHOIV,1,2)	MIPREP,	Processes modal input to allow for interpolation and calculation of control rotations.
	(RHOIV,1,3)	RESPREP,	Prepares the basic downwash matrix, and any result information that can be calculated prior to the condition cycle.
	(RHOIV,1,4)	RDWRTC,	Performs all I/O and library work associated with a user C-matrix file.
	(RHOIV,1,5)	CMCALC,	Calculates C-matrices for main surface or control surface pressure terms for a particular condition.
	(RHOIV,1,6)	SOLN,	Prints intermediate results and solves for the unknown coefficients of main surface pressure terms for a particular condition.
	(RHOIV,1,7)	RESULTS,	Calculates all unsteady pressures, sectional and total generalized forces using the information produced in RESPREP and SOLN.

(Primary subroutine names are listed below main programs)

Figure 6.—Overlay Structure

(RHOIV,1,8) IMDOUT, Calculates interpolated modal values at selected output points and/or downwash points—Prints and/or plots results.

4.2 COMMON BLOCK USAGE

The RHOIV program uses both BLANK and LABELED common.

The LABELED common blocks are used for communication between the primary and secondary overlays, and for communication between routines in a secondary overlay. The block names and contents are described on the following pages.

The T heading on the following pages refers to variable type: I – Integer, R – Real, C – Complex, L – Logical, H – Hollerith.

BLANK common is used in most secondary overlays as a variable length working area. In general, the program of an overlay calculates the area required for arrays in the various subroutines and passes a dimension and first word address of each array through the subroutine calling sequence. A description of the area used by each overlay is given in section 3.3.

Labeled common name:		BASIC		Load level:		Primary (1,0)	
Description:		Basic information, used by all modules.					
No.	Variable	T	Dim.	Eng. nom.	Description		
1	INDCM	I	9		C-MATRIX CALCULATION INDICATOR, 0-MAIN SURFACE, >0-CONTROL SURFACE		
2	SYM	I			ANALYSIS SYMMETRY INDI- CATOR 1-SYMMETRIC 2-ANTISYMMETRIC		
3	B0	R		b ₀	REDUCED FREQUENCY REFERENCE LENGTH		
4	S	R		S	PLANFORM SEMI-SPAN		
5	YROOT	R			Y VALUE OF PLANFORM ROOT STATION		
6	KVAL	R		k = ω/V	K-VALUE, REDUCED FREQUENCY		
7	KVALR	R		k _r = b ₀ ω/V	REFERENCE K-VALUE		
8	KSQD	R		k ²			
9	MACH	R		M	MACH NO.		
10	BETA	R		β = √1-M ²			
11	BETASQD	R		β ²			
12	RTITLE	I			USER RUN TITLE, WITH DATE APPENDED		

Labeled common name: CMLIB Load level: PRIMARY (1,0)					
Description: Variables describing the contents of CMFILE are maintained in CMLIB during the condition cycle.					
No.	Variable	T	Dim.	Eng. nom.	Description
1	FINDCM	L			INDICATOR TO SEARCH FOR A C-MATRIX
2	CMFOUND	L			INDICATOR FOR C-MATRIX FOUND
3	IDNAME	I			INDEX MATRIX NAME = 10HCMFIL INDEX ON WRITE, CHECKED ON READ
4	NOCM	I			NUMBER OF C-MATRICES ON CMFILE
5	NMSNTRY	I			NUMBER OF MAIN SURFACE ENTRIES IN INDEX, (=NO. MAIN SURFACE C-MATRICES ON CMFILE)
6	CDATE	I			LIBRARY CREATION DATE
7	LMDATE	I			LAST DATE C-MATRICES ADDED
8	LINDEX	I			LENGTH OF CMFILE INDEX
9	MSENTRY	I			POSITION WITHIN INDEX OF A MAIN SURFACE ENTRY
10	NCSE	I			NUMBER OF CONTROL SURFACE ENTRIES ASSOCIATED WITH A MAIN SURFACE ENTRY
11	MATPOS	I			MATRIX POSITION WITHIN CMFILE
12	RDATE	I			CURRENT DATE

Labeled common name:		CMVAL	Load level:		SECONDARY (1,5)
Description:		Used by most C-Matrix routines.			
No.	Variable	T	Dim.	Eng. nom.	Description
1	ROWC	C	(72,8)	C	ROWS OF C-MATRIX ASSOCIATED WITH DOWNWASH POINTS ON CHORD
2	GXY	C	(72,8)	$G(x,y,y)$	SUBTRACTION TERMS ASSOCIATED WITH EVALUATION OF DIPOLE SINGULARITY
3	GPXY	C	(72,8)	$G'(x,y,y)$	
4	T1XY	C	(72,8)	$T1(x,y,y)$	SUBTRACTION TERMS FOR LOG SINGULARITY
5	CIPK	C	16		CHORDWISE INTEGRAL OF PRESSURE TERMS TIMES KERNEL
6	KERN	C		$K(x_0,y_0,k,M)$	KERNEL FUNCTION VALUE

Labeled common name: COND		Load level: PRIMARY (1,0)			
No.	Variable	T	Dim.	Eng. Nom.	Description
1	NOKVAL	I			NUMBER OF K-VALUES, REDUCED FREQUENCIES
2	KVALUES	R	20		K-VALUES
3	NOMACH	I			NUMBER OF MACH NUMBERS
4	MACHNO	R	20		MACH NUMBERS

Labeled common name:		COUNT	Load level:		PRIMARY (1,0)
Description: Miscellaneous counters used during condition cycle to size working storage.					
No.	Variable	T	Dim.	Eng. nom.	Description
1	NSPT	I			NUMBER OF SPANWISE MAIN SURFACE PRESSURE TERMS
2	NCPT	I			NUMBER OF CHORDWISE MAIN SURFACE PRESSURE TERMS
3	NPTRM	I			TOTAL NUMBER OF ASSUMED MAIN SURFACE PRESSURE TERMS
4	NDMDS	I			NUMBER OF DISPLACEMENT MODES
5	NPMDS	I			NUMBER OF PRESSURE MODES (NOTE, EXCEPT IN THE CASE OF A GUST ANALYSIS, NDMDS = NPMDS. FOR A GUST ANALYSIS NPMDS = NDMDS + 1.)
6	NZONES	I			NUMBER OF MODAL INPUT ZONES
7	MIPTS	I			MAXIMUM NUMBER OF INPUT POINTS IN ANY MODAL INPUT ZONE
8	MIPSGF	I			MAXIMUM NUMBER OF QUADRA- TURE CHORDS REQUIRED FOR SPAN- CHORDWISE INTEGRATION FOR ANY SECTIONAL FORCE OUTPUT CHORD
9	MICGF	I			MAXIMUM NUMBER OF QUADRA- TURE CHORDS REQUIRED FOR SPANWISE INTEGRATION FOR TOTAL GENERALIZED FORCES
10	MIPGF	I			MAXIMUM NUMBER OF QUADRA- TURE POINTS REQUIRED FOR CHORDWISE INTEGRATION ALONG ANY QUADRATURE CHORD FOR TOTAL GENERALIZED FORCES
11	NOVP	I			NUMBER OF VELOCITY PROFILES
12	LOCVP	I			LOCATION OF VELOCITY PROFILE INFORMATION IN BLANK COMMON
13	NPRC	I			NUMBER OF PRESSURE REPORT CHORDS
14	NPPRC	I			NUMBER OF POINTS/PRESSURE REPORT CHORD
15	NPPT	I			TOTAL NO. PRESSURE OUTPUT POINTS
16	NSGFC	I			NUMBER OF SECTIONAL FORCE OUTPUT CHORDS

No.	Variable	T	Dim.	Eng. nom.	Description
17	NMOC	I			NUMBER OF USER SELECTED POINTS PER MODAL OUTPUT CHORD
18	MNPMOC	I			MAXIMUM NUMBER OF POINTS PER MODAL OUTPUT CHORD (IF IMODWP THIS INCLUDES NPDWC)

Labeled common name: CQUAD Load level: SECONDARY (1,5/7)					
Description: Used by CHDINT and Chordwise Quadrature routines in C-matrix calculation. DELXI is also used during sectional and total generalized force integration.					
No.	Variable	T	Dim.	Eng. nom.	Description
1	XILIL	R		ξ_L	ξ OF CHORDWISE INTEGRATION REGION LOWER LIMIT
2	XIUIL	R		ξ_U	ξ OF CHORDWISE INTEGRATION REGION UPPER LIMIT
3	DELXI	R		$\xi_U - \xi_L$	
4	XIMID	R		$(\xi_U + \xi_L) / 2$	

Labeled common name: CSTERM		Load level: SECONDARY (1,5/7)			
Description: Used by TETERM, DTETERM, LETERM, DLETERM, DCPFXI, GXYYCAL					
No.	Variable	T	Dim.	Eng. nom.	Description
1	EPY0	R		$\eta + \gamma_o$	
2	EPYI	R		$\eta + \gamma_i$

Labeled common name: CSVAL		Load level: SECONDARY (1,1-3/5/7)			
Description: Used by TETERM, DTETERM, LETERM, DLETERM, most terms generated by CSINIT.					
No.	Variable	T	Dim.	Eng. nom.	Description
1	INDCS	I			INDICATOR FOR TYPE CONTROL SURFACE, 1-FULL, 2-TIP, 3-MID, 4-PARTIAL
2	LECS	L			INDICATOR FOR LEADING EDGE CONTROL, .T.=LEADING EDGE, .F.=TRAILING EDGE.
3	SYMSF	R		S_f	SYMMETRY SIGN FACTOR +1.0 - SYMMETRIC ANALYSIS -1.0 - ANTISYMMETRIC ANALYSIS
4	YCSI	R		y_i	INBOARD CONTROL SIDE EDGE
5	XHCSI	R		x_i	INBOARD CONTROL HINGE POINT
6	XLCSI	R			LEADING EDGE VALUE AT INBOARD CONTROL SIDE EDGE
7	YCSO	R		y_o	OUTBOARD CONTROL SIDE EDGE
8	XHCSO	R		x_o	OUTBOARD CONTROL HINGE POINT
9	XLCSO	R			LEADING EDGE VALUE AT OUTBOARD CONTROL SIDE EDGE
10	DELYCS	R		$y_o - y_i$	CONTROL SPAN
11	TANLH	R		$\tan \Lambda_H$	TANGENT OF HINGE SWEEP ANGLE
12	BETAH	R		β_H	
13	BHSQD	R		β_H^2	
14	TANLL	R		$\tan \Lambda_L$	TANGENT OF LEADING EDGE SWEEP, FOR A LEADING EDGE CONTROL
15	BETAL	R		β_L	
16	BLSQD	R		β_L^2	
17	XIE1	R			PHYSICAL, OR CONSTANT PERCENT CHORD EXTENSION OF HINGE FOR E1 FUNCTION IN TETERM
18	DXIE1E	R		$\frac{\partial XIE1}{\partial \eta}$	

Labeled common name:		DWPTS		Load level:		PRIMARY (1,0)	
Description:		Used in INPREP, DWPREP, RDWRTC, and CMCALC					
No.	Variable	T	Dim.	Eng. nom.	Description		
1	NDWC	I	72	Y	NUMBER OF DOWNWASH CHORDS		
2	YDWC	R			DOWNWASH CHORDS, SPANWISE COORDINATE VALUES FOR DOWNWASH POINTS		
3	NPDWC	I			NUMBER OF POINTS PER DOWNWASH CHORD		
4	NDWP	I	72	X	TOTAL NUMBER OF DOWNWASH POINTS (=NDWC*NPDWC)		
5	XDWP	R			DOWNWASH POINT STREAMWISE COORDINATE VALUES		

Labeled common name:		ENDIT	Load level:		PRIMARY (1,0)
Description: Read in INPREP – used by RHOIV. Specifies termination procedure.					
No.	Variable	T	Dim.	Eng. nom.	Description
1	LNAME	I			TERMINATION INDICATOR = $\left\{ \begin{array}{l} \text{BLANK} \\ \text{"EXIT"} \end{array} \right\}$ CALL EXIT = "RETURN", EXECUTE RETURN OTHERWISE CALL OVERLAY (LNAME,L1,L2,0)
2	L1	I			PRIMARY LEVEL OVERLAY NO.
3	L2	I			SECONDARY LEVEL OVERLAY NO.

Labeled common name:		FILES		Load level:	PRIMARY (1,0)
Description:		Defines all files used within the program.			
No.	Variable	T	Dim.	Eng. nom.	Description
1	MIFILE	I			MODAL INPUT FILE NAME
2	CMFILE	I			C-MATRIX FILE NAME
3	DPFILE	I			DELTA PRESSURE FILE NAME
4	SGFFILE	I			SECTIONAL FORCE FILE NAME
5	GFFILE	I			GENERALIZED FORCE FILE NAME NOTE 1-5 ARE USER ASSIGNED NAMES
6	IN	I			STANDARD INPUT FILE NAME
7	OUT	I			STANDARD OUTPUT FILE NAME
8	RHOSC1	I			SCRATCH FILE NO. 1 NAME
	(MISFILE)	I			MODAL INFORMATION SCRATCH
	(RESFILE)	I			FILE NAME, RESULT SCRATCH
					FILE NAME
9	RHOSC2	I			SCRATCH FILE NO. 2 NAME
	(INSFILE)	I			INPUT SCRATCH FILE NAME
	(CMSFILE)	I			C-MATRIX SCRATCH FILE NAME
	(COFFILE)	I			COEFFICIENT FILE NAME
10	MIF1	I			INITIAL FILE POSITION OF MIFILE
11	CMF1	I			INITIAL FILE POSITION OF CMFILE
12	DPF1	I			INITIAL FILE POSITION OF DPFILE
13	SGFF1	I			INITIAL FILE POSITION OF SGFFILE
14	GFF1	I			INITIAL FILE POSITION OF GFFILE

Labeled common name:		FLCNTRL		Load level:	PRIMARY (1,0)
Description:		Field length control/utilization information.			
No.	Variable	T	Dim.	Eng. nom.	Description
1	CURFL	I			CURRENT PROGRAM FIELD LENGTH
2	MAXFL	I			MAXIMUM PROGRAM FIELD LENGTH USED TO CURRENT TIME
3	INITL	I			INITIAL PROGRAM FIELD LENGTH
4	JOBFL	I			JOB CARD FIELD LENGTH (I.E., MAXIMUM ALLOWABLE FIELD LENGTH
5	INPFL	I			MINIMUM FL REQUIRED FOR INPREP
6	MIPFL	I			MINIMUM FL REQUIRED FOR MIPREP
7	RESPFL	I			MINIMUM FL REQUIRED FOR RESPREP
8	RWCFL	I			MINIMUM FL REQUIRED FOR RDWRTC
9	CMCFL	I			MINIMUM FL REQUIRED FOR CMCALC
10	SOLNFL	I			MINIMUM FL REQUIRED FOR SOLN
11	RESFL	I			MINIMUM FL REQUIRED FOR RESULTS
12	IMOFL	I			MINIMUM FL REQUIRED FOR IMDOUT
13	LIIA	I			LENGTH OF INTERPOLATION INFORMATION ARRAYS
14	LVP	I			LENGTH OF VELOCITY PROFILE INFORMATION
15	LCCR	I			LENGTH OF CONTROL ROTATION COEFFICIENTS INFORMATION

Labeled common name: KRNTerm Load level: SECONDARY (1,5)					
Description: Used by kernel function routines.					
No.	Variable	T	Dim.	Eng. nom.	Description
1	FK	R		fk	ARBITRARY POINT FOR SPLITTING INTEGRAL IN ROSEL'S KERNEL FORMULATION (FK = 2π)
2	FKSQD	R		(fk) ²	
3	RFKSKYS	R		$\sqrt{(fk)^2 + (ky_o)^2}$	
4	HK	R		hk	UPPER INTEGRATION LIMIT
5	HKSQD	R		(hk) ²	
6	RHKSKYS	R		$\sqrt{(hk)^2 + (ky_o)^2}$	
7	HOYO	R		$\frac{h}{y_o}$	$\int_{-\infty}^h \frac{\tau e^{iky_o \tau}}{\sqrt{1 + \tau^2}} d\tau$
8	APROXR	R			
9	APROXI	R			
10	S1R	R			$\int_{-\infty}^{-kf} \frac{e^{i\lambda}}{[\lambda^2 + (ky_o)^2]^{3/2}} d\lambda$
11	S1I	R			
12	S2R	R			
13	S2I	R			$\int_{-kf}^{kh} \frac{e^{i\lambda} - 1 - i\lambda + \lambda^2/2}{[\lambda^2 + (ky_o)^2]^{3/2}} d\lambda$
14	S3R	R			
15	S3I	R			

Labeled common name: KRNVAR Load level: SECONDARY (1,5)					
Description: Used by C-matrix chordwise quadrature routines, and kernel function.					
No.	Variable	T	Dim.	Eng. nom.	Description
1	IDWC	I			DOWNWASH CHORD NO.
2	Y	R		y	Y VALUE OF DOWNWASH POINT
3	IPDWC	I			POINT/DOWNWASH CHORD
4	IDWP	I			DOWNWASH POINT NO.
5	X	R		x	DOWNWASH POINT
6	YO	R		y_0	
7	YOSQD	R		y_0^2	
8	KYO	R		$k y_0 $	
9	KYOSQD	R		$(ky_0)^2$	
10	BYOSQD	R		$(\beta y_0)^2$	
11	BKYOSQD	R		$(\beta ky_0)^2$	
12	XO	R		x_0	
13	KXO	R		kx_0	
14	CMACH	R		$1n(2-2M)/2$	CONSTANT FOR KERNEL CALCULATION

Labeled common name: LCSTERM Load level: SECONDARY (1,5/7)					
Description: Miscellaneous terms associated with full chord control pressure expressions.					
No.	Variable	T	Dim.	Eng. nom.	Description
1	CIS	C	4	C_{IS}	COEFFICIENT/SIDE EDGE FOR INVERSE SQUARE ROOT TERMS
2	CSI	C	4	C_{SI}	COEFFICIENTS/SIDE EDGE FOR SQUARE ROOT TERM ASSOCIATION WITH FIRST SOLUTION
3	CS2	C	4	C_{S2}	SAME AS C_{S1} EXCEPT FOR SECOND SOLUTION
4	CL1	C	4	C_{L1}	COEFFICIENTS/SIDE EDGE FOR FIRST SOLUTION
5	CL2	C	4	C_{L2}	SAME AS C_{L1} EXCEPT FOR SECOND SOLUTION
6	CAT	C	4	C_{AT}	COEFFICIENTS/SIDE EDGE FOR ARC TANGENT TERM
7	AYS	R	4		ARRAY OF Y_s FOR ALL SIDE EDGES
8	ASTANLL	R	4		ARRAY OF $\tan \Lambda_L$ FOR ALL SIDE EDGES
9	AXS	R	4		ARRAY OF $\xi_c(y_s)$ FOR ALL SIDE EDGES
10	E3	R			
11	E2	R			
12	IFSE	I			
13	ILSE	I			

Labeled common name: OPTIONS Load level: PRIMARY (1,0)					
Description: Miscellaneous options.					
No.	Variable	T	Dim.	Eng. nom.	Description
1	VELPFL	L			VELOCITY PROFILE OPTION .T.=PROFILES EXIST
2	DGUST	L			DISCRETE GUST OPTION
3	GPGUST	L			GRADUAL PENETRATION GUST OPTION
4	GPREF	R			GRADUAL PENETRATION GUST REFERENCE POINT
5	IIAIN	L			INDICATOR FOR DIRECT INPUT OF IIA PER MODAL INPUT ZONE
6	RESULT	L			INDICATOR FOR SOME RESULTS REQUIRED, I.E. EITHER UNSTEADY PRESSURE, SECTIONAL FORCES OR GENERALIZED FORCES
7	SOLUTION	L			INDICATOR FOR SOLUTION REQUIRED, I.E. EITHER RESULT OR C-MATRIX, DOWNWASH MATRIX, ON PRESSURE COEFFICIENT MATRIX OUTPUT REQUESTED

Labeled common name:		PLNGEO		Load level:	PRIMARY (1,0)	
Description: Defines planform geometry.						
No.	Variable	T	Dim.	Eng. nom.	Description	
1	MSID	I			MAIN SURFACE C-MATRIX I.D.	
2	NLE	I			NUMBER OF LEADING EDGE DEFINITION POINTS	
3	XLE	R	10		LEADING EDGE DEFINITION POINTS (STRAIGHT LINE SEGMENTS)	
4	YLE	R	10			
5	DXLEDY	R	9		SLOPE OF LEADING EDGE SEGMENTS	
6	NTE	I			NUMBER OF TRAILING EDGE DEFINITION POINTS	
7	XTE	R	10		TRAILING EDGE DEFINITION	
8	YTE	R	10		POINTS (STRAIGHT LINE SEGMENTS)	
9	DXTEDY	R	9		SLOPE OF TRAILING EDGE SEGMENTS	
10	NOCS	I			NUMBER OF CONTROL SURFACES	
11	XHLI	R	6		CONTROL SURFACE HINGE IN- BOARD DEFINITION POINT	
12	YHLI	R	6			
13	XHLO	R	6		CONTROL SURFACE HINGE OUT- BOARD DEFINITION POINT	
14	YHLO	R	6			
15	DXHLDY	R	5		SLOPE OF CONTROL HINGE	
16	CSID	I	6		CONTROL SURFACE C-MATRIX I.D.	
17	CSTYPE	I	6		CONTROL SURFACE TYPE	
18	CSRS	I	6		CONTROL SURFACE RELATED SURFACE	
19	CSAO	I	6		CONTROL SURFACE AREA ORDER	
20	CSRI	I	6		CONTROL SURFACE INPUT INDICATOR	
21	XHLBI	R	6		HINGE INBOARD SIDE EDGE DEFINITION POINT VALUE IN BAR NOTATION	
22	XHLBO	R	6		HINGE OUTBOARD SIDE EDGE DEFINITION POINT VALUE IN BAR NOTATION	
23	XLEI	R	6		LEADING EDGE VALUE AT THE CON- TROL INBOARD SIDE EDGE	
24	XLEO	R	6		LEADING EDGE VALUE AT THE CONTROL OUTBOARD SIDE EDGE	

Labeled common name: PRSPVAL Load level: SECONDARY (1,1-3/5/7)					
Description: Used to specify (ξ, η) values to ETACVAL and other routines. Describes current chord, control surface and pressure type.					
No.	Variable	T	Dim.	Eng. nom.	Description
1	ETA	R		η	SPANWISE LOCATION OR COORDINATE
2	AETA	R		$ \eta $	
3	ETAB	R		$\underline{\eta}$	NON-DIMENSIONAL SPANWISE COORDINATE
4	XI	R		ξ	CHORDWISE (STREAMWISE) LOCATION OR COORDINATE
5	XIB	R		$\underline{\xi}$	NON-DIMENSIONAL CHORDWISE COORDINATE
6	DXIBE	R		$\frac{\partial \xi}{\partial \eta}$	
7	ICS	I			CONTROL SURFACE NUMBER (=0 WHEN NO CONTROL SURFACE IS CONCERNED)
8	CPT	L			CONTROL PRESSURE INDICATOR, CPT=.T. IF CONTROL SURFACE PRESSURE TERM IS BEING CALCULATED.
9	XIL	R		ξ_l	PLANFORM LEADING EDGE VALUE AT η
10	DXILE	R		$\frac{\partial \xi_l}{\partial \eta}$	
11	XIM	R		ξ_m	PLANFORM MIDCHORD VALUE AT η
12	XIC	R		ξ_c	PLANFORM CONTROL NO. ICS HINGE VALUE AT η . (NOTE – THIS MAY BE A LINEAR EXTENSION.)
13	DXICE	R		$\frac{\partial \xi_c}{\partial \eta}$	
14	XIT	R		ξ_t	PLANFORM TRAILING EDGE VALUE AT η
15	DXITE	R		$\frac{\partial \xi_t}{\partial \eta}$	
16	B	R		b	PLANFORM SEMI-CHORD VALUE AT η
17	KIND	I			KERNEL INDICATOR, USED ONLY DURING C-MATRIX CALCULATION
18	CQTYPE	I			CHORDWISE QUADRATURE TYPE, USED DURING C-MATRIX CALCULATION, AND SECTIONAL AND TOTAL GENERALIZED FORCES.

Labeled common name:		PRSTERM		Load level: SECONDARY (1,3/5)	
Description:		Used by PRSPREP, SGFPREP, GFPREP, and most C-matrix calculation routines.			
No.	Variable	T	Dim.	Eng. nom.	Description
1	FETA	R	72	$f(\eta)$	SPANWISE MAIN SURFACE PRESSURE TERMS
2	FPETA	R	72	$f'(\eta)$	
3	NCPTERM	I			NUMBER OF CHORDWISE PRESSURE TERMS
4	CPTERM	R	16	$g(\xi,\eta)$ or $\frac{\partial g(\xi,\eta)}{\partial \eta}$	CHORDWISE PRESSURE TERMS

Labeled common name:		PRTCTL	Load level:		PRIMARY (1,0)
Description: Controls all printed output in result and solution sections.					
No.	Variable	T	Dim.	Eng. nom.	Description
1	DPPRT	I			DELTA PRESSURE PRINT CONTROL
2	SGFPRT	I			SECTIONAL GENERALIZED FORCE PRINT CONTROL
3	GFPRT	I			GENERALIZED FORCE PRINT CONTROL
4	CMPT	I			C-MATRIX PRINT CONTROL
5	DWMPRT	I			DOWNWASH MATRIX PRINT CONTROL
6	PCMPRT	I			PRESSURE COEFFICIENT MATRIX PRINT CONTROL n < 0 all conditions (on input) = 0 – no print n > 0 – print first n condition
7	IMOPRT	I			INTERPOLATION MODAL OUTPUT CONTROL
8	IMOPLT	I			INTERPOLATED MODES PLOT CONTROL
9	IMODWP	L			INDICATOR FOR INTERPOLATED MODAL OUTPUT AT DOWNWASH POINTS

Labeled common name:		QUADWTS		Load level:	PRIMARY (1,0)
Description: Used by GFSGRID, GFCGRID in prep. routines, and by CMCALC and chordwise quadrature routines in C-matrix calculation.					
No.	Variable	T	Dim.	Eng. nom.	Description
1	ALEG4	R	2		<u>PREFIX</u> A – ABSCISSAE H – WEIGHTS <u>ROOT</u> – TYPE QUADRATURE WEIGHT FUNCTION LEG – LEGENDRE ISQR – INVERSE SQUARE ROOT SQR – SQUARE ROOT LOG – LOG 4THR – FOURTH ROOT <u>SUFFIX</u> – NO. QUADRATURE POINTS
2	HLEG4	R	2

18	H4THR5	R	5		
19	A4THR10	R	10		
20	H4THR10	R	10		

Labeled common name:		SGCOM		Load level: PRIMARY (1,0)	
Description: Used by SGRID, SGLECS, SGTECS, SGCSLHS, and SGMAIN in determining the spanwise grid.					
No.	Variable	T	Dim.	Eng. nom.	Description
1-40	IFL1...IFL40	I			BINARY FLAGS
41	LEG0	I			DUMMY QUADRATURE TYPE
42	LEG2	I			2 POINT LEGENDRE QUADRATURE
43	LEG3	I			3 POINT LEGENDRE QUADRATURE
44	LEG4	I			4 POINT LEGENDRE QUADRATURE
45	LEG6	I			6 POINT LEGENDRE QUADRATURE
46	LEG8	I			8 POINT LEGENDRE QUADRATURE
47	SQRT2	I			2 POINT SQUARE ROOT QUADRATURE
48	SQRT3	I			3 POINT SQUARE ROOT QUADRATURE
49	SQRT5	I			5 POINT SQUARE ROOT QUADRATURE
50	SQRT8	I			8 POINT SQUARE ROOT QUADRATURE
51	SQRT10	I			10 POINT SQUARE ROOT QUADRATURE
52	DELL	R			SPANWISE PEAK OFFSET DIST. FOR POINTS NEAR THE L.E.
53	DELT	R			SPANWISE PEAK OFFSET DIST. FOR POINTS NEAR THE T.E.
54	DELC	R			SPANWISE PEAK OFFSET DIST. FOR POINTS NEAR THE HINGE LINE.

Labeled common name: SQUAD						Load level: SECONDARY (1,5)	
Description: Used by CMCALC, SPNINT							
No.	Variable	T	Dim.	Eng. nom.	Description		
1	SQTYPE	I			SPANWISE QUADRATURE TYPE		
2	SQWT	R			SPANWISE QUADRATURE WEIGHT		
3	ETALIL	R		η_L	η OF LOWER LIMIT FOR A SPANWISE INTEGRATION REGION		
4	ETAUIL	R		η_U	η OF UPPER LIMIT FOR A SPANWISE INTEGRATION REGION		
5	DELETA	R		$\eta_U - \eta_L$	SPANWISE INTEGRATION REGION WIDTH		
6	ETAMID	R		$\frac{(\eta_U + \eta_L)}{2}$	REGION MIDPOINT		
7	ALNDELY	R		$\ln \left[\frac{(\eta_U - \eta_L)}{S} \right]$			
8	ETAL	R		η_ℓ	η VALUE OF LOG SINGULARITY LOCATION DURING SPANWISE INTEGRATION. IT IS EITHER THE DOWNWASH CHORD, OR A CONTROL SIDE EDGE		

Labeled common name:		TIMES		Load level:		PRIMARY (1,0)	
Description: Accumulated Cp times and number of entries for various secondary level overlays.							
No.	Variable	T	Dim.	Eng. nom.	Description		
1	TINP	R			ACCUMULATED CP TIME IN INPREP		
2	TMIP	R			ACCUMULATED CP TIME IN MIPREP		
3	TRESP	R			ACCUMULATED CP TIME IN RESPREP		
4	NTRWC	I			NO. ENTRIES INTO RDWRTC		
5	TRWC	R			ACCUMULATED CP TIME IN RDWRTC		
6	NTCMC	I	5		1) ASSOCIATED WITH MAIN SURFACE, $k = 0$ 2) ASSOCIATED WITH MAIN SURFACE, $k > 0$ 3) ASSOCIATED WITH CONTROL SURFACE, $k = 0$ 4) ASSOCIATED WITH CONTROL SURFACE, $k > 0$ 5) TOTAL 1) - 4)		
7	TCMC	R	5		ACCUMULATED CP TIME IN CMCALC (SAME AS NTCMC)		
8	NTSOLN	I			NO. ENTRIES INTO SOLN		
9	TSOLN	R			ACCUMULATED CP TIME IN SOLN		
10	NTRES	I			NO. ENTRIES INTO RESULTS		
11	TRES	R			ACCUMULATED CP TIME IN RESULTS		
12	TIMDO	I			ACCUMULATED CP TIME IN IMDOUT		

4.3 PROGRAM/SUBROUTINE DESCRIPTION

Short abstracts for the various programs and subroutines in RHOIV are included in this section. A full description of each routine may be found in the program listing.

Routines are ordered alphabetically. Their relative positions within the program may be obtained from the load map.

(1) SUBROUTINE AINTL (X, Y, NPTS, Z, NROWZ, NCOL1, NCOLS, SA, INDD, DZ1, DZ2)

Interpolation cover routine for generation of displacements and slopes at unsteady aerodynamics control points—specified in the local axis system.

(2) SUBROUTINE APROX

Routine APROX performs the integration of $\text{TAU} \cdot \exp(I \cdot \text{KYO} \cdot \text{TAU}) / \sqrt{1 + \text{TAU}^2}$. In TAU from $-\infty$ to H. The function $\text{TAU} / \sqrt{1 + \text{TAU}^2}$ is approximated by a series of exponentials (see ref. 7), $\text{TAU} / \sqrt{1 + \text{TAU}^2} = .1 + C1 \cdot \exp(E1 \cdot \text{TAU}) + C2 \cdot \exp(E2 \cdot \text{TAU}) + C3 \cdot \exp(E3 \cdot \text{TAU}) \cdot \sin(\text{PI} \cdot \text{TAU})$

(3) SUBROUTINE AZONE (Y, X, NPTS, IND, ZONE)

Assign a modal input zone number to points on chord Y.

(4) FUNCTION BESK1 (X)

BESK1 = K1(X), modified Bessel function of the second kind of order 1. K1(X) is calculated with two polynomial expansions, one for X.LT.2, and one for X.GE.2. Equations taken from reference 5.

(5) FUNCTION BI1ML1 (X)

BI1ML1 = (I1(X) - L1(X)) where I1 = Modified Bessel function of the first kind of order 1, L1 = Struve function.

Series expansion for I1-L1 is used for X.LE. 12.8, an asymptotic expansion is used for X.GT. 12.8.

Equations taken from reference 5.

Struve Functions and Related Functions, 12.2.6 Asymptotic Expansion p. 498, 12.2.1 Power Series p. 498.

Bessel Functions of Integer Order, 9.6.10 Ascending Series, p. 378.

(6) BLKDATA

Defines all quadrature abscissae and weights.

(7) SUBROUTINE CCRRDR (CCR, NPMOS)

Read cubic coefficients of control rotation.

(8) SUBROUTINE CGRID (NIR, XIQ, IRTYPE)

Routine CGRID defines the chordwise integration schemes used to integrate chordwise pressure terms times one of the kernel expressions on a specified chord.

(9) SUBROUTINE CHDINT

Perform the chordwise integration of chordwise pressure terms times kernel function.

(10) OVERLAY (RHOIV, 1,5) PROGRAM CMCALC

Calculate a C-matrix associated with main surface or control surface pressure terms for a set of downwash points at a particular k-value Mach number condition.

(11) SUBROUTINE CMSTERM

Calculate NCPTERM chordwise pressure terms associated with the assumed main surface pressure terms.

(12) SUBROUTINE CPFCTXI

Calculate NCPTERM chordwise pressure terms

KIND = GXYY, calculate $G(XI,Y)$, $DG(XI,Y)/DETA$

= non-sing or singular calculate $G(XI,ETA)$

CPT = .F.-main surface terms, .T.-control surface terms

LECS = .FALSE.-calculate only T.E. control surface terms
.TRUE.-calculate both T.E. and L.E. control surface terms

(13) SUBROUTINE CQISR5

Perform A 5 point inverse square root quadrature on chordwise pressure term times kernel function for XI over XILIL to XIUIL where the square root singularity is at XILIL.

(14) SUBROUTINE CQISR10

Perform a 10 point inverse square root quadrature on chordwise pressure term times kernel function for XI over XILIL to XIUIL where the square root singularity is at XILIL.

(15) SUBROUTINE CQLEG4

Perform a 4 point Gauss-Legendre quadrature on chordwise pressure term times kernel function for XI over XILIL to XIUIL.

(16) SUBROUTINE CQLEG8

Perform an 8 point Gauss-Legendre quadrature on chordwise pressure term times kernel function for XI over XILIL to XIUIL.

(17) SUBROUTINE CQLOG4

Perform a combination 4 point log and 4 point Legendre quadrature on chordwise pressure term times kernel function for XI over XILIL to XIUIL where the log singularity is at XILIL.

(18) SUBROUTINE CQLOG8

Perform a combination 8 point log and 8 point Legendre quadrature on chordwise pressure term times kernel function for XI over XILIL to XIUIL where the log singularity is at XILIL.

(19) SUBROUTINE CQSQR5

Perform a 5 point square root quadrature on chordwise pressure term times kernel function for XI over XILIL to XIUIL where the square root slope singularity is at XILIL.

NOTE: Abscissae and weights developed from Gauss-Mehler form, (see ref. 4) using BCS program MEHQA (Redman 1973) with ALPHA = 0, BETA = .5.

(20) SUBROUTINE CQSQR10

Perform a 10 point square root quadrature on chordwise pressure term times kernel function for XI over XILIL to XIUIL where the square root slope singularity is at XILIL.

NOTE: Abscissae and weights developed from Gauss-Mehler form, (see ref. 4) using BCS program MEHQA (Redman 1973) with ALPHA=0, BETA=.5.

(21) SUBROUTINE CQ4R5

Perform a 5 point fourth root quadrature on chordwise pressure term times kernel function for XI over XILIL to XIUIL where the 3/4 root slope singularity is at XILIL.

NOTE: Abscissae and weights developed from Gauss-Mehler form, (see ref. 4) using BCS program MEHQA (Redman 1973) with ALPHA=0, BETA=.25.

(22) SUBROUTINE CQ4R10

Perform a 10 point fourth root quadrature on chordwise pressure term times kernel function for XI over XILIL to XIUIL where the 3/4 root slope singularity is at XILIL.

NOTE: Abscissae and weights developed from Gauss-Mehler form, (see ref. 4) using BCS program MEHQAII (Redman 1973) with ALPHA=0, BETA=.25.

(23) SUBROUTINE CRCOEFF (NZONES, NDMDS, NPMDS, DELDZDX, CCR,
1 Z, IIA, IIAI)

Calculate (or read) the cubic coefficients of control surface rotation for subsequent use in the preparation routines. The coefficients are defined such that

$$\begin{aligned} \text{THETA (ETA)} &= \text{CO} + \text{C1} * \text{EBCS} + \text{C2} * \text{EBCS} ** 2 + \text{C3} * \text{EBCS} ** 3 \\ &= \text{change in streamwise modal slope,} \\ &\quad \text{DELTA DZ/DX, at the hinge.} \\ \text{EBCS} &= \text{fraction (0., 1.) of control span} \\ &\quad \text{(0. inboard, 1.0 outboard)} \end{aligned}$$

(24) SUBROUTINE CTHETA (DELDZDX, NDMDS)

Given four equally spaced points on a control hinge, and DELTA DZ/DX at these points, determine the coefficients of the cubic which will define DELTA DZ/DX, THETA, on the hinge.

(25) SUBROUTINE CSINCK (CSAREA, PLNERR, CSERR)

Read control surface input. Check legality. Assign control type, and determine related surfaces.

(26) SUBROUTINE CSINIT

Initialize variables for a control surface and generate coefficients of control pressure expression.

(27) SUBROUTINE DCPFXI

Calculate the derivative of the pressure term G(XI,ETA) with respect to XI for a main surface, trailing and leading edge controls.

(28) SUBROUTINE DLETERM (DGXIETA)

Calculate the derivative of the pressure term G(XI,ETA) with respect to ETA for a leading edge control surface.

(29) SUBROUTINE DTETERM (DGR, DGI)

Calculate the derivative of the pressure term for a trailing edge control, DG(XI,ETA)/
DETA = (DGR,DGI)

(30) SUBROUTINE DWINCK (PLNERR, DWERR)

Read (or use default definition for) downwash chords and points, convert from bar notation if required, and check legality.

(31) SUBROUTINE DWPREP (NDWC, NPDWC, NDWP, NDWP2, NOCS, NZONES,
1 NDMD5, NPMDS, YDWC, XDWP, X, Y, ZONE, IPOS,
2 NPZONE, Z, ZT, DZDX, DZDXT, W, WRI, IIA, IIAP, CCR)

Form the basic downwash matrix, $[W] = [DZ/DX + I*Z]$, and write to RESFILE. The real portion of W is modified by any user supplied velocity profile, and a gust mode of the desired form is appended if requested. Any existing cubic coefficients of control rotation are copied from memory to RESFILE.

(32) SUBROUTINE ERRPRT (IERRNO, ERRFLG, I1, I2)

Set error flag and print appropriate error message.

(33) SUBROUTINE ETACVAL

Given a spanwise station, ETA, determine the leading edge, trailing edge, and hinge line (if applicable) intersects, and calculate semi-chord and mid-chord values.

(34) SUBROUTINE FIND(A,N,IOPT,X,LOC)

In the array A (non-decreasing sequence), locate X, the first element less than or equal to X, or the first element greater than or equal to X, depending on the value of IOPT. Used in routine SGRID.

(35) SUBROUTINE FORMDP (NPRC, NPPRC, NPPT, NPTRM, NOCS, NPMDS,
1 YPRC, XPPT, XBAR, PRESS, MSPTRM, GXIETA,
2 CMSPT, FETA, AMPPHAS)

Calculate unsteady delta pressure at an indicated set of points (output points) for a k-value/Mach no. condition.

$$\text{DELP}(X,Y;J) = \text{SUM}[\text{MSPTRM}(X,Y;I) * \text{CMSPT}(I,J) , I=1, \text{NPTRM}] + \\ \text{SUM}[\text{FETA}(Y,J) * \text{GXIETA}(X,Y;N), N = 1, \text{NOCS}]$$

(36) SUBROUTINE FORMQ (NDMDS, NPMDS, NPTRM, NOCS, MICH, MPICH, Q,
1 QMSPT, CMSPT, YICH, GXIETA, XIPT, QTYPE, FETA,
2 WZ)

Calculate the generalized unsteady aerodynamic coefficient matrix (generalized forces) for a k-value/Mach number condition.

$$Q(I,J) = \text{INTEGRAL} [Z(XI,ETA;I) * DELP(XI,ETA;J) * D[XI] * D[ETA]]$$

$$XI = XIL(ETA), XIT(ETA)$$

$$ETA = O, S$$

(37) SUBROUTINE FORMQS (NSGFC, NDMDS, NPMDS, NPTRM, NOCS, MPSGFC,
1 Y, QS, QSMSPT, CMSPT, GXIETA, XIPT, QTYPE,
2 FETA, WZ)

Calculate the sectional generalized unsteady aerodynamic coefficient matrices (sectional forces) at an indicated set of chords for a k-value/Mach no. condition.

$$QS(Y;I,J) = \text{INTEGRAL} [Z(XI,Y;I) * (DELP(XI,Y;J) * D[XI])]$$

$$XI = XIL(Y), XIT(Y)$$

(38) SUBROUTINE GFCGRID (NIPTS, NPZONE, XIPT, CQWT, QTYPE)

Determine the quadrature points and associated weights to be used in integrating delta pressure times displacements along a chord for sectional or total generalized forces.

(39) SUBROUTINE GFSGRID (NICH, YICH, SQWT)

Determine the quadrature chords and associated weights to be used in the spanwise integration of delta pressure times displacements for total generalized forces.

(40) SUBROUTINE GFPREP (MICH, MPCH, NZONES, NDMDS, NPMDS, NSPT,
1 NCPT, NPTRM, YICH, SQWT, NIPTSZ, XIPT,
2 YIPT, CQWT, QTYPE, QMSPT, Z, WZ, G FETA, IIA,
3 IIA, CCR, MICGF, MIPGF)

Prepare information, independent of k-value and Mach no., which will be used for calculation of generalized unsteady aerodynamic coefficients (generalized forces). The information is written to RESFILE.

(41) SUBROUTINE GXYICAL

Calculate G(X,Y,Y) AND GP(X,Y,Y) for all points on a downwash chord and initialize the associated C-matrix rows.

(42) SUBROUTINE IIACAL (NZONES, MIPTS, MEQNS, NDMDS, X, Y, Z,
1 IIA)

Generate the interpolation information array for each modal input zone and save on MISFILE.

(43) SUBROUTINE IIARDR (IIAP, IIA, LIIA)

Read the interpolation information arrays.

(44) OVERLAY (RHOIV, 1, 1) PROGRAM INPREP

Process all user input.

(45) SUBROUTINE INSERT (A, N, IFLAG, NUM, A1, A2, A3, A4, A5, A6, A7, A8,
1 A9, A10, A11, A12, A13, A14, A15, A16, A17, A18, A19,
2 A20, A21, A22, A23, A24, A25, A26, A27, A28, A29, A30,
3 A31, A32, A33, A34, A35, A36, A37, A38, A39, A40)

Insert selected values into the array A. Used with the spanwise grid procedures – SGCSLHS, SGLECS, SGMAIN, SGTECS.

(46) SUBROUTINE KRNFACT

Calculate the desired kernel function as specified by KIND, e.g., GXYY, NON-SING, SINGULAR.

(47) SUBROUTINE LETERM (GXIETA)

Calculate the pressure term G(XI,ETA) for a leading edge control surface.

(48) SUBROUTINE MATIO (LFN, MATRIX, MROWD, MROW, MCOL, LID, ID, IRR)

Read/write a two record set consisting of an ID record describing a matrix or array, and the matrix record.

(49) SUBROUTINE MIINCK (NROWZ, X, Y, IPOS, ZONE, Z, IIA, NIPTS, PLNERR,
1 MIERR)

Read modal input (from INPUT or MIFILE), check legality, and write by input zone to INSFILE. Alternatively, read interpolation information arrays by input zone and write directly to MISFILE. The information is used in MIPREP and RESPREP.

(50) OVERLAY (RHOIV, 1, 2) PROGRAM MIPREP

Allocate working area for the modal preparation routines which will generate information on MISFILE to be used in RESPREP.

(51) SUBROUTINE NAMBLD (NMFILE)

Convert NMFILE = NM to NMFILE = TAPENM

(52) SUBROUTINE NOPLCM(I)

Normalize planform and control surface geometry by semispan on the first call from CMCALC. Restore the original geometry on second call.

(53) SUBROUTINE PCMDWN (NDWP, NPTRM, NOCS, NPMDS, C, CS, AS, W, WRI)

Print the C-matrices associated with regular (main surface) assumed pressure terms and any control surface pressure term. Print the kinematic downwash matrix, and the residual downwash matrix (the kinematic downwash matrix with any control surface singularities removed).

(54) SUBROUTINE PLATEO (XO, YO, NOPTS, ZO, NROWZ, NCOL1, NCOLS, SA,
1 INDD, DZ1, DZ2)

Given the spline coefficients for a set of functions as determined in routine PLATEI, and the associated input points, calculate the values of the functions (and optionally the derivatives) at a set of output points.

(55) SUBROUTINE PCMSPT (NDWP, NPMDS, CMSPT)

Print the coefficients of the regular (main surface) assumed pressure terms.

(56) SUBROUTINE PLATEA (X, Y, INDS, SK, N, M, A, IRR)

Form the coefficient matrix for system of equations, SK = smoothing constant (ratio of plate stiffness to input point spring stiffness).

		* 1 X(1) Y(1)	Where A(I,J)= R**2 LN(R**2), I≠J
		* — — —	
A(I,J)		* — — —	= 0, I=J INDS = 0
		* — — —	
		* 1 X(N) Y(N)	= SK(1), I=J INDS=1
		*	
		*****	= SK(I), I=J INDS=2
		*	
1 ——— 1		* 0 0 0	R=(X(I)-X(J))**2
X(1)---- X(N)		* 0 0 0	+(Y(I)-Y(J))**2
Y(1)---- Y(N)		* 0 0 0	N=No. points, M=N+3= No. eqs.

(57) SUBROUTINE PLATEI (XI, YI, MIPTS, ZI, NROWZ, MCOL1, MCOLN, MCOLS,
1 SA, INDS, SK)

Perform a bivariate interpolation using as the interpolating function the small deflection equation of an infinite pinned plate (see ref. 6).

(58) SUBROUTINE PLATET (XU, YV, NIND, XBAR, YBAR, COST, SINT, RGU, RGV)

Perform a transformation of coordinates from (X,Y) to (U,V) if NIND > 0, or from (U,V) to (X,Y) if NIND < 0.

```

      *U*   *1/RGU   0      * * COST SINT* *X-XBAR*
      * * = *
      *V*   *   0  1/RGV   * * -SINT COST * *Y-YBAR*

```

Where COST = COS (THETA), SINT = SIN(THETA), THETA is that angle such that
 PUV = SUM[U(I)*V(I)]N = 0, RGU, RGV = radii of gyration in (U,V), XBAR, YBAR =
 C.G. location in (X,Y) - note UBAR, VBAR = 0,0

(59) SUBROUTINE PLNINCK (PLNERR)

Read the leading edge and trailing edge definition, and check for compatibility.

(60) SUBROUTINE PRSINCK (YPRC, XPPT, PLNERR, PRSERR)

Read (or use default) pressure output chord and point values, check for legality and save on INSFILE.

(61) SUBROUTINE PRSPREP (NPRC, NPPRC, NPPT, NSPT, NCPT, NPTRM, MOCS,
 1 NPMD5, YPRC, XPRT, MSPTRM, FETA, CCR)

Prepare information, independent of k-value and Mach no., which will be used during calculation of unsteady delta pressures. The information is written to RESFILE.

(62) OVERLAY (RHOIV, 1,4) PROGRAM RDWRTC

Perform all read/write activities associated with the CMFILE library of C-matrices and its index.

(63) SUBROUTINE REMOVE (A,N,IFLAG)

Remove selected values from the array A. Used in routine SGRID.

(64) OVERLAY (RHOIV, 1,3) PROGRAM RESPREP

Allocate working area for the various preparation routines which will in turn generate information which is placed on RESFILE for subsequent use in solving for the coefficients of the assumed main surface pressure terms, and in calculation of unsteady pressures, sectional forces, or total generalized force results.

(65) OVERLAY (RHOIV, 1,7) PROGRAM RESULTS

Allocate working area for the result routines which will in turn generate the requested results for printed or user file output.

(66) OVERLAY (RHOIV, 1,0) PROGRAM RHOIV

Calculate the unsteady aerodynamic loadings on a lifting surface with leading and/or trailing edge sealed gap controls undergoing harmonic motions in subsonic compressible flow.

(67) SUBROUTINE RTHETA (PRESS, AMPPHAS, NPPT, NMDS)

Convert pressure at a point from (X+IY) form to (R, THETA).

(68) SUBROUTINE SCAMP4 (X,Y,N,NDA,NDB,DA,DB,C,S,M)

Given a set of N points whose abscissae form a strictly monotone sequence, and given a first or second derivative at X(1) and a first or second derivative at X(N), to find the smoothest possible curve passing rigorously through the given points, satisfying the specified boundary conditions, and possessing continuous first and second derivatives. The criterion of smoothness is the minimization of the integral of the square of the second derivative, and the curve found is accordingly a chain of cubics, i.e., a separate cubic on each interval X(I), X(I+1).

(69) SUBROUTINE SERIES1

Routine SERIES1 performs the integration of

$$\text{EXP}(I*\text{LAMBDA})/(\text{LAMBDA}^{**2} + (K*Y0)^{**2})^{**1.5}$$

In LAMBDA from $-\infty$ to $-K*F$, where $K*F = 2*PI$. A change of variables is made, and a series expansion of the denominator is written. Using partial integration a recursion formula is developed which converges to within required accuracy in ten iterations or less.

(70) SUBROUTINE SERIES2

Routine SERIES2 performs the integration of

$$(\text{EXP}(I*\text{LAMBDA}) - 1 - I*\text{LAMBDA} + .5*\text{LAMBDA}^{**2})/(\text{LAMBDA}^{**2} + (K*Y0)^{**2})^{3/2}$$

In LAMBDA from $-K*F$ to $K*H$, when $K*H > -K*F$ where $K*F = 2*PI$. A series expansion of the exponent is written. The first three terms of the series cancel with the remaining three terms in the numerator. Performing partial integration twice, a recursion formula for the integral of the remaining terms is developed which converges to within the required accuracy within 50 iterations or less ($K*H \leq 15$).

(71) SUBROUTINE SERIES3

Routine SERIES3 performs the integration of

$$\text{EXP}(I*\text{LAMBDA})/(\text{LAMBDA}^{**2} + (K*Y0)^{**2})^{**1.5}$$

In LAMBDA from $-\infty$ to $K*H$ when $K*H \leq -K*F$, $K*F = 2*PI$. SERIES3 is the same as SERIES1 except the sine and cosine integrals of the upper integration limit cannot be precalculated.

(72) SUBROUTINE SGCSLHS(ETAQ,NEP)

Computes the spanwise integration grid for a control surface — left hand side. Subordinate to routines SGRID, SGLECS, and SGTECS.

(73) SUBROUTINE SGFINCK (YSGFC, PLNERR, SGFERR)

Read (or use default values for) sectional force output chords for legality and save on INSFILE.

(74) SUBROUTINE SGFPREP (NSGFC, MPCHD, NZONES, NDMDS, NPMDS, NSPT,
1 NCPT, NPTRM, YSGFC, NIPTSZ, XIPT, YIPT, CQWT,
2 QTYPE, QSMSPT, Z, WZ, FETA, IIA, IIAP, CCR,
3 MIPSGF)

Prepare information, independent of k-value and Mach no., which will be used for calculation of sectional generalized unsteady aerodynamic coefficients (sectional forces). The information is written to RESFILE.

(75) BLOCK DATA SGINIT

Defines /SGCOM/ — values shared by the spanwise grid procedures. See SGRID description.

(76) SUBROUTINE SGLECS(ETAQ, NEP)

Computes the spanwise integration grid for a leading edge control surface. Subordinate to routine SGRID.

(77) SUBROUTINE SGMAIN (ETAQ, NEP)

Computes the spanwise integration grid for the main surface. Subordinate to routine SGRID.

(78) SUBROUTINE SGRID (NIR, ETAQ, IRTYPE)

Routine SGRID defines the spanwise integration scheme used to integrate the spanwise integrand of the downwash integral equation for all downwash points on a specified downwash chord.

(79) SUBROUTINE SGTECS (ETAQ, NEP)

Computes the spanwise integration grid for a trailing edge control surface. Subordinate to routine SGRID.

(80) SUBROUTINE SICI

Computes the sine and cosine integral.

(81) OVERLAY (RHOIV, 1,6) PROGRAM SOLN

Allocate working area for the solution routine and intermediate output routines.

(82) SUBROUTINE SOLVE (NDWP, NPTRM, NOCS, NPMDS, MMDS, C, SCR, IPR,
1 CS, AS, W, WRI)

Solve the complex linear system of equations for the coefficients of the assumed regular (main surface) pressure terms and save on COFFILE.

(83) SUBROUTINE SPFCTE

Calculate NSPT spanwise pressure terms

KIND = GXYY, calculate $F(ETAB)$ and $FP(ETAB) = DF(ETAB)/DELTA$

= NON-SING, or SINGULAR, calculate $F(ETAB)$

CPT = .F. — main surface terms, ≠ .T. — control surface terms

(84) SUBROUTINE SPNINT

Evaluate the spanwise integrand at ETA, and increment the C-matrix terms by the weighted results.

(85) SUBROUTINE TETERM (GR, GI)

Calculate the pressure term $G(XI,ETA) = CMPLX(GR,GI)$ for a trailing edge control.

(86) SUBROUTINE VPINCK (VPERR)

Read velocity profiles, check for legality, form a cubic spline for each profile, and save on INSFILE.

(87) SUBROUTINE ZEROCOL (M, NF, NL, Z, NROWZ, INDD, DZ1, DZ2)

Initialize columns NF–NL to zero for M rows.

(88) OVERLAY (RHOIV, 0,0) PROGRAM ZRHOIV

Call overlay RHOIV (1,0)

APPENDIX A NUMERICAL INTEGRATION TECHNIQUES

The basic work performed by the RHOIV program is numerical integration. In particular this includes the surface integration of the pressure kernel expression of the downwash integral equation (equation (5)), or the integration along a chord of unsteady pressure times modal deflection for sectional generalized forces (equation (21)), or the surface integration of unsteady pressure times modal deflection for total generalized forces (equation (22)). The numerical integration is accomplished using Gaussian quadrature of the general form.

$$\int_{\alpha}^{\beta} w(t)f(t)dt \approx \sum_1^{\eta} H_i f(a_i) \quad (A1)$$

where $f(t)$ = the function to be integrated with the associated term,
 $w(t)$ = a known positive function of t , the weight function.

and H_i = the quadrature weights corresponding to,
 a_i = the quadrature abscissae.

The abscissae are roots of an n th degree polynomial which is orthogonal with respect to the weight function $w(t)$ on (α, β) . A discussion of the existence and determination of the set of a_i and corresponding H_i for which equation (A1) will be exact, provided $f(t)$ is of degree $\leq 2n-1$, is given in reference 4, chapter VII. The properties of a_i and H_i include,

$$\begin{aligned} a_i & \text{ real and distinct} \\ H_i & > 0, i = 1, \dots, n \\ \alpha & < a_i < \beta, i = 1, \dots, n \end{aligned}$$

$$\sum_1^{\eta} H_i = \int_{\alpha}^{\beta} w(t) dt$$

The usual approach is to determine a_i and H_i for a known interval, e.g., $(0,1)$, and perform a linear transformation of variables from, for example, x on (a,b) to t on $(0,1)$.

The weight functions used within RHOIV are:

$w(t) = 1$ (for which the abscissae are roots of an n th degree Legendre polynomial on (α, β) – referred to as Legendre quadrature)

$w(t) = \sqrt{t - \alpha}$ (referred to as square root quadrature)

$w(t) = 1/\sqrt{t - \alpha}$ (referred to as inverse square root quadrature)

$w(t) = \ln(t - \alpha)$ (referred to as log quadrature)

For integration performed in evaluation of the downwash integral equation, the integrand and its first derivative are well behaved over the majority of the surface, thus Gauss-Legendre quadrature is most prevalently used. However, the chordwise pressure terms for both main surface and control surface analyses have a square root (or similar order) discontinuity in the first derivative at the planform leading and trailing edges. Additionally, the spanwise terms for both analyses have a square root (or similar order) discontinuity in the first derivative at the planform tips. The spanwise integrand contains a logarithmic singularity at a downwash chord (y), and a logarithmic singularity exists in the chordwise pressure term at a physical control surface hingeline. The spanwise singularity is subtracted from the integrand and evaluated in closed form outside the integral (see reference (2)), thus eliminating the need for log quadrature in the spanwise integration scheme. Note that the downwash effect of the chordwise singularity at the hingeline is evaluated, using both Log and Legendre quadratures in the region about the hingeline.

For integration performed in calculation of sectional and total generalized forces, the kernel function singularities are not involved, however, the singularities associated with the pressure terms remain and are handled in the same manner.

The form of the quadratures used is,

Gauss-Legendre Quadrature

$$\int_a^b f(x) dx = (b-a) \int_0^1 f(t) dt \approx (b-a) \sum_{i=1}^n H_i f(x_i) \quad (A2)$$

where $n = 4$ or 8

H_i = the n point Gauss-Legendre quadrature weights

$x_i = (b-a)t_i + a$, t_i = the n point Gauss-Legendre quadrature abscissae (note that H_i and x_i are symmetric about $(b+a)/2$)

Square Root Quadrature

$$\begin{aligned} \int_a^b \sqrt{x-a} f(x) dx &= (b-a) \int_0^1 \sqrt{(b-a)t} f(t) dt = (\sqrt{b-a})^3 \int_0^1 \sqrt{t} f(t) dt \\ &\approx (\sqrt{b-a})^3 \sum_{i=1}^n H_{s_i} f(x_i) \end{aligned}$$

where $n = 5$ or 10

H_{s_i} = the n point Square Root Quadrature weights

$X_i = (b - a) t_i + a$, t_i = the n point Square Root Quadrature abscissae

$f(x) = g(x) / \sqrt{x - a}$, where $g(x)$ has the characteristic of $\sqrt{x - a}$

Inverse Square Root Quadrature

$$\begin{aligned} \int_a^b f(x) / \sqrt{x - a} dx &= (b - a) \int_0^1 f(t) / \sqrt{(b - a)t} dt = \sqrt{b - a} \int_0^1 f(t) / \sqrt{t} dt \\ &\approx \sqrt{b - a} \sum_{i=1}^n H_{s_i} f(x_i) \end{aligned}$$

where $n = 5$ or 10

H_{s_i} = the n point Inverse Square Root Quadrature weights

$x_i = (b - a) t_i + a$, t_i = the n point Inverse Square Root Quadrature abscissae

$f(x) = g(x) \sqrt{x - a}$, where $g(x)$ has a square root singularity of the form $1 / \sqrt{x - a}$

Log (Plus Legendre) Quadrature

$$\begin{aligned} \int_a^b \ln|x - a| f(x) dx &= (b - a) \int_0^1 \ln|(b - a)t| f(t) dt \\ &= (b - a) \ln|b - a| \int_0^1 f(t) dt + (b - a) \int_0^1 \ln|t| f(t) dt \\ &\approx (b - a) \ln|b - a| \sum_{i=1}^n H_i f(x_i) - (b - a) \sum_{j=1}^n H_{1_j} f(x_j) \end{aligned}$$

where $n = 4$ or 8

H_i and x_i are as defined in (A2)

H_{1_j} = the n point Log quadrature weights associated with $w(t) = \ln(1/t)$.

$x_j = (b - a) t_j + a$, t_j = the n point Log quadrature abscissae

$f(x) = g(x) / \ln|x - a|$, where $g(x)$ has a logarithmic singularity of the form $\ln|x - a|$

APPENDIX B

MODAL INTERPOLATION

If input points and modal displacements are provided by the user to RHOIV, the surface spline method of Harder and Desmarais, Reference 6, is used to allow interpolation for displacements and streamwise slopes at downwash points, and displacements at quadrature points used for sectional and total generalized force integration.

If control surfaces exist, the lifting surface planform is divided into modal input zones, as illustrated in figure 8, page 155, each of which must have a sufficient number of input points to define the motion within that region.

The user has two options when describing lifting surfaces with controls:

- (1) Provide a discrete set of input points with associated modal displacements for each modal input zone
- (2) Provide a total set of points with associated modal displacements which includes points in all zones

In the first case, the input points for an input zone need not lie within the boundaries of that zone. In the second case RHOIV will assign an input zone to each point based on the boundaries shown in figure 8. In either case a minimum of three (3) input points must be associated with each input zone; the interpolation procedure described below is applied per input zone.

The control surface pressure modes are a function of control rotation, $\theta(\eta)$, or the change in streamwise slope across a control hinge. Unless the user specifically provides this information, RHOIV will determine θ_H by calculating the slope at the hinge using the interpolating functions for the two modal input zones on either side of the hinge.

With a reasonably even distribution of points in a zone, the surface spline approach provides good results for displacements, and reasonable results for slopes at points interior to the input point set. At the extremities of input point regions, a fair amount of curvature may exist, introducing sometimes large "errors" in the slopes. This is particularly significant since the leading edge and any control hinge tend to lie at the extremities of input point sets and thus errors in boundary condition at the leading edge, and control rotation θ_H , may be introduced.

For any particular planform configuration, the user should initially examine the kinematic downwash and control rotations to assure the sufficiency of his input point distribution. If the user is unable to cause reasonable control rotation values to be calculated by moving input points or including more input points, the option to input control rotation information should be used.

IF REASONABLE SLOPES AT DOWNWASH POINTS AND CONTROL ROTATION VALUES ARE NOT CALCULATED, THE PROGRAM RESULTS WILL HAVE NO SIGNIFICANCE

If the surface spline approach is used, the modes are approximated by (ref. 6)

$$Z(\xi, \eta) \approx \sum_1^N a_i R_i^2 \cdot \ln(R_i^2) + a_{N+1} + a_{N+2} \xi + a_{N+3} \eta$$

$$R_i = (\xi - x_i)^2 + (\eta - y_i)^2$$

$$(x_i, y_i) = N \text{ input points}$$

under the constraints

$$Z(x_i, y_i) = Z_I(x_i, y_i), i = 1, N$$

where

$$Z_I(x_i, y_i) = \text{input values at } (x_i, y_i),$$

and

$$\sum_1^N a_i = 0, \sum_1^N a_i x_i = 0, \sum_1^N a_i y_i = 0$$

which expressed in matrix form for n input modes,

$$\begin{bmatrix} & & & 1 & x_1 & y_1 \\ & & & \vdots & \vdots & \vdots \\ & A_{ij} & & \vdots & \vdots & \vdots \\ & & & 1 & x_N & y_N \\ \hline 1 & \dots & 1 & & & \\ x_1 & \dots & x_N & & 0 & \\ y_1 & \dots & y_N & & & \end{bmatrix} \cdot \begin{bmatrix} \{a\}_1 \dots \{a\}_n \end{bmatrix} = \begin{bmatrix} \{Z_I(x_i, y_i)\}_1 \dots \{Z_I(x_i, y_i)\}_n \end{bmatrix}$$

$$A_{ij} = \begin{cases} 0, & i=j \\ R_{ij}^2 \cdot \ln(R_{ij}^2), & i \neq j \end{cases}$$

$$R_{ij}^2 = (x_i - x_j)^2 + (y_i - y_j)^2$$

is a linear system of equations which may be solved for the interpolating function coefficients.

Then for any output point, (ξ, η) ,

$$\begin{bmatrix} Z(\xi, \eta)_1, \dots, Z(\xi, \eta)_n \end{bmatrix} = \begin{bmatrix} a_{ij} \end{bmatrix} \begin{pmatrix} A_i \\ 1 \\ \xi \\ \eta \end{pmatrix} \quad A_i = R_i^2 \cdot \ln(R_i^2), i = 1, N$$

$$\left[\frac{\partial Z(\xi, \eta)_1}{\partial x}, \dots, \frac{\partial Z(\xi, \eta)_n}{\partial x} \right] = [a_{ij}] \begin{Bmatrix} B_i \\ 0 \\ 1 \\ 0 \end{Bmatrix} \quad B_i = 2(\xi - x_i) \left[\ln(R_i^2) + 1 \right], \quad i = 1, N$$

where $Z(\xi, \eta)$ has the properties

$$Z(x_i, y_i) = Z_1(x_i, y_i), \quad i = 1, N$$

$$\frac{\partial^2 Z(\xi, \eta)}{\partial x^2}, \frac{\partial^2 Z(\xi, \eta)}{\partial x \partial y}, \frac{\partial^2 Z(\xi, \eta)}{\partial y^2} \rightarrow 0 \text{ as the distance to the input point} \rightarrow \infty$$

$Z(\xi, \eta)$ is analytic everywhere except at (x_i, y_i)

$$\frac{\partial Z(\xi, \eta)}{\partial x}, \frac{\partial Z(\xi, \eta)}{\partial y} \text{ exist at } (x_i, y_i)$$

If $N = 3$ and the points are noncolinear, a simple plane is defined for $Z(\xi, \eta)$.

Note that a simple bending mode (1st, 2nd, etc.) is not adequately defined by input points lying in two lines because of the tendency of the interpolation function used to force curvature to zero in both coordinates.

The change in slope at a control hinge for a spanwise station y is determined by calculating the slope at the hinge using first the interpolation information for the surface to which the control is related, and then using the interpolation information for control surface itself. Rather than calculate the slope analytically, which, in the case of a surface spline representation, may introduce control rotations where none exist, a numerical procedure is used.

At a spanwise station y , three equally spaced points (including the hinge) are selected over a sufficiently small region, δ , e.g., $2\delta = (x_3 - x_1) = .005S$, so that it can be assumed that no curvature of the physical planform exists. If the displacements at the points are determined, a quadratic in $(x - x_1)$ may be written,

$$Z(x) = A_1 + B(x - x_1) + C(x - x_1)^2,$$

or

$$\partial Z(x) / \partial x = B + 2C(x - x_1)$$

Solving the system of three equations and neglecting C ,

$$\partial Z(x) / \partial x = B = [4Z(x_2) - 3Z(x_1) - Z(x_3)] / 2\delta$$

Note that if the slope is a constant over (x_1, x_3) initially,

$$C = \left\{ [Z(x_3) - Z(x_1)] / \delta - [Z(x_2) - Z(x_1)] / \delta \right\} / \delta$$

This procedure should reduce the introduction of extaneous control rotations in noncontrol-rotation modes.

16. Abstract Based on the analyses in NASA CR 2543 and CR 3009, a digital computer program has been developed to calculate unsteady loadings caused by motions of lifting surfaces with leading edge and trailing edge controls based on the subsonic kernel function approach. The pressure singularities at hinge line and side edges have been extracted analytically as a preliminary step to solving the integral equation of collocation. The program calculates generalized aerodynamic forces for user supplied deflection modes. Optional intermediate output includes pressure at an array of points, and sectional generalized forces. From one to six controls on the half span can be accommodated.
